# THE BEST BBC MICRO SOFTWARE

PRODUCED BY AN INDEPENDENT SOFTWARE HOUSE  
 • TOP QUALITY MACHINE-CODE PROGRAMS •

# BBC

**BACKPACK (32K)** £2.95  
 Spectacularly detailed animation (the best we've yet seen) as Quasmodus leaps over the ramparts dodging rocks and arrows, swinging on ropes, and avoiding the guards' spears as he attempts to rescue Xenodotus. Twelve different scenes of action! This program is sold under licence from Century Electronics Ltd, we have exclusive rights to its sale for use on the BBC micro.  
 (For use with KEYBOARD or JOYSTICK).

"... an extremely good version of the arcade game thoroughly recommended." ... **REEDUC MAGAZINE**

**CRAZY PAINTER (32K)** £2.95  
 The only full feature version available for the BBC micro. On the first screen, you take the part of a monkey being chased by African tribesmen. If you manage to survive by painting in all the squares, the bonus screen features the monkey trying to reach his bunch of bananas. After that, you take control of a space roller and each square painted adds to your score. But beware ... the teddy bears are now in hot pursuit. Spectacular animation and sound effects.  
 (For use with KEYBOARD or JOYSTICK).

\*\*\* NEW RELEASE \*\*\*

**SPACE DOCKING (32K)** £2.95  
 A space docking simulator using 3D graphics to model the motions and responses of the ORION 4 spacecraft. Your mission is to guide the shuttle in a "soft dock" with the space station. PITCH, YAW, ROLL, FORWARD, LATERAL and VERTICAL engines are provided together with a full manoeuvring booster engine. Skill levels provide for the completely inexperienced pilot as well as the fully fledged commander.  
 \*\*\* NEW RELEASE \*\*\*

**ALIEN DROP OUT (32K)** £2.95  
 A novel and unusual program. Arcade-action with this enthralling multi-stage shooting game. You have to shoot the aliens out of their "buses" before the "buses" fill up. Once full, the aliens fly down relentlessly, exploding as they hit the ground. 10 score, run and shoot effects.  
 (For use with KEYBOARD or JOYSTICK).  
 This game is as good as any on the market ... **HOME COMPUTING WEEKLY**

**FAIRGROUND (32K)** £2.95  
 An exciting target shooting game! Bonuses are scored for spelling out the word FAIRGROUND by hitting the appropriate target letters, and for shooting all the targets. Extra bonuses are obtained by shooting the numerical targets, but watch out for the "smiley" who are intent on slowing your bullets. Music, sound effects, to action, and rainbow.

\*\*\* NEW RELEASE \*\*\*

**CENTIPEDE (32K)** £2.95  
 Incredible arcade-style game featuring multicolours, scrolls, fast updates and the complexities of mazes. Excellent graphics and sound. 4 skill levels, to score, outposts, bonuses, and increasing difficulty as the spiders become more lively and the number of mazes increases.

(For use with KEYBOARD or JOYSTICK).

"Finally the game compares well with the arcade version, being colourful and clear"  
 ... **YOUR COMPUTER**

**ROAD RUNNER (32K)** £2.95  
 The only full feature machine-code version available for the BBC micro. Features include: scrolling screens, radar gauge, 4 punning cars, checkpoint flags, fuel gauge, smoke screens, 4 skill levels, mazes, increasing difficulty and sound effects.  
 (For use with KEYBOARD or JOYSTICK).

"I enjoyed the game very much ... the graphics are excellent ... movement is smooth and fast as only machine code can produce" ... **HOME COMPUTING WEEKLY**

**FROGGER (32K)** £2.95  
 Not just another version of Frogger ... this is the simulation version that you've been waiting for. Graphically brilliant with gazing-mouthed crocodiles, diving turtles, fish, and frogs that first take legs as they jump along becoming 4-frogs and independent controls.  
 (For use with KEYBOARD or JOYSTICK).

"... very good indeed ... but factor-line graphics and a boy that really hops" ... **REEDUC MAGAZINE**

ALL OUR PRICES ARE INCLUSIVE OF V.A.T. AND P.A.P.

**DISC SOFTWARE AVAILABLE NOW**

All our programs are ready for dispatch on 5 1/4" discs at £11.95 each.

### OUR GUARANTEE

- (1) All our software is available before we advertise.
- (2) All our software is dispatched within 48 hours by first-class post.
- (3) In the unlikely event that any of our software fails to load, return your cassette or disc to us and we will immediately send a replacement.

## Now a monthly publication

**T**HIS ISSUE of Acorn Programs has some major changes. The magazine is now monthly, so you will not have to wait so long for your next copy, which will appear in November and our constantly expanding editorial section has grown even further to reflect every aspect of the BBC and Electron software scene.

This month Clive Williamson has assessed the present batch of low-cost business programs — page 16 — Eric Deeson surveys the educational market on page 21, we interview Charles Moir, author of a best-selling word processor on page 26, and Chris Naylor considers the new BBC/Acorn contract on page 19. You will still find our usual software reviews and programming advice, but do not miss our exciting competition — page 29 — or the special offer program on page 46.

Your program listings have not been forgotten and we are launching a new beginners' section for those who are new to computing. We hope you will continue to send us your excellent contributions. Each disc or cassette should be accompanied by your name and address and a brief description of the program. All entries must also be accompanied by the coupon on page 42.

As usual, our listings have been made for working copies of the programs, and all will run on the BBC B, including those written for the Electron.

# Acorn wins new BBC contract

THE CONTRACT with Acorn Computers for the BBC computer has been extended for another four years. The agreement runs from September 1, 1984.

The deal was signed despite a number of approaches from other manufacturers, including Sinclair Research, which was disappointed at not winning the original contract.

The decision was taken on the basis that it would ensure continuity, although it is reported that there will be enhancements and improvements to the Model B.

Bill Cotton, managing director and chairman of BBC Enterprises, said: "Following the enormous success we have had with Acorn in the last three years with the BBC microcomputer I am delighted that we have a further agreement."

Chris Curry, managing di-

rector of Acorn, said he thought the BBC micro was the centre of an expanding system which would be capable of meeting the needs of a wide range of users. He pinpointed three areas for possible expansion — hardware, software and overseas sales.

The BBC Computer Literacy Project, which is based on the BBC B, is in its third year. The Corporation plans to have more new series, as well as producing books and software and repeating old se-

ries. More than 350,000 BBC microcomputers have now been sold.

"Much of the success of the BBC microcomputer is due to the combination of the BBC's pioneering excellence in programme production and broadcasting technology and Acorn skills in computer design. In the next four years we intend to work out natural extensions to this relationship which will take it into new areas of technology" Curry said.

THE QUEEN inspects an Acorn computer at the Women's Institute Life and Leisure exhibition at Olympia, London. Acorn was the only computer exhibitor at the show and set up 29 BBC micros and Electrons to show visitors the capabilities of the machines.

Almost all the stand demonstrators were women, as part of the Acorn campaign to raise women's awareness of computers and technology. The event was reported to be a great success, with more than 100 visitors regularly at the Acorn stand.

## Electron expansion

NEW ADD-ONS are appearing for the Electron with increasing frequency.

First Byte has launched a printer interface to complement the company's earlier joystick interface. Available from W H Smith and other dealers, the printer interface costs £34.95 including VAT.

Broadway Electronics has produced a sideways ROM card which plugs into the Electron expansion port. The device enables users to plug in up to four chips which were compatible only with the BBC previously. Word processing, accounts, spreadsheet and other programs turn the Electron into a low-cost business machine. The Mushroom sideways ROM card costs £29.95.

## O level students are put to the test

ACORNSOFT has released a series of O level and CSE revision programs for the BBC and the Electron. Based on current O level syllabuses, the courses are designed to help students study for their examinations at home.

The four programs — two maths, one English language and one biology — have up to 150 pages of tutorial, with a 10-question revision test at the end of each section. A mock examination completes each program.

The maths and English programs were compiled by a group of teachers at University College School in London, and the biology program was compiled by the educational publishing house Hodder and Stoughton. The programs are available on cassette and cost £12.65 each.

In a less serious vein, Acornsoft has also released five new arcade and adventure games for the BBC and converted six of its most popular existing titles for the Electron. The new Electron conversions comprise three favourite arcade games — **Hopper**, **Freefall** and **Aradians** — as well as **Sphinx Adventure**, and two home interest programs, **Desk Diary** and **Picture Maker**. Each cassette retails at £9.20.

## Teachers' favourite

A RECENT survey has revealed that almost three-quarters of schools and colleges in Britain use a BBC B. That is far ahead of the next most important machine, the Research Machines 480-Z with machines in 19 percent of schools and colleges and the Sinclair Spectrum with 14 percent.

The survey also predicted that the BBC B will account for almost two-thirds of pur-

chases of new educational computers this year.

Chris Curry, managing director of Acorn Computer group, said: "Its results clearly demonstrate that the BBC micro is the most important computer in education and one which is proving to be as valuable a tool in universities and colleges as it is in primary and secondary schools."

In higher education the fig-

ures showed that 84 percent of institutions chose the BBC while the figures for primary and secondary were 73 percent and 78 percent.

The results showed also that there is strong support for the machine among teachers. Of those who own a computer at home, 46 percent chose the BBC.

The survey was carried out by *Educational Computing* in February this year.

# Adaptor seeks gold

ACORN HAS launched a new viewdata interface which links the BBC micro to Prestel and Telecom Gold, British Telecoms electronic mail service.

Costing £113.85, the Pres-

tel adaptor connects directly with the telephone network, turning the computer into a two-way terminal. Users can access the database of consumer and business information published by Prestel,

as well as its teleshopping facilities, and the Micronet 800 telesoftware and Viewfax information services.

They can also send and receive electronic mail via Telecom Gold. The adaptor includes an autodial facility and can handle telephone numbers stored by the computer on disc or tape.

The adaptor is available by mail order only from Vector Marketing, London Road, Denington Estate, Wellesborough, Northamptonshire NN8 2RL.

Imperial/Triumph Adler is claiming to be the first Euro-

pean typewriter and systems manufacturer to be supplying Telecom Gold with its equipment. The company is offering its Bitsy word processor with an optional modem which links to the telephone socket.

The system allows companies to send letters, memos, reports and messages to any other system, which uses a similar mailbox.

The cost of Bitsy-Telecom Gold systems starts at £3,500 for single disc drive, 128K memory, screen, keyboard, dot matrix printer and software.

## Network speeds the results

A NETWORKED BBC microcomputer system was a novel feature of the British Grand Prix race meeting at Brands Hatch.

The computers and software, supplied by Acorn, were designed to improve the distribution of information about the race, drivers, teams, and the organisation of the event. A BBC micro in the pit area issued news, via an Econet system, to strategically-placed monitors for the benefit of the press, officials and VIPs. It was the first time such a system had been used at a Formula One event.

BBC television commentator Murray Walker said the system proved invaluable. "I

was getting up-to-the-minute information faster than ever before. Also during the race we had a television monitor failure and I was able to use the information on the Acorn system to fill in the background."

## Cedric to reveal the beauty of gas

THE BRITISH GAS energy study is attracting great interest from schools and organisations throughout the country. By the beginning of July, 2,000 entries had been

received and that was a long time before the closing date.

The study, entitled Energy Study U.K., is a competition for secondary schools which is intended to help students improve their understanding of energy use and saving. Teams will calculate and analyse energy use in their own and neighbours' homes, compare the effects of various energy-saving methods and produce a program for energy-saving in the community.

To a large extent the competition is based on a specially-written British Gas program called Cedric, which runs on the BBC B as well as other popular home micros.

Many teachers are said to have been so impressed with Cedric that they are to use it to teach children the capabilities of computers.

The closing date for the competition is December 28, after which there will be regional awards ceremonies next February and the national finals will take place in May. Regional winners will receive £200 for the school and team members will receive £10 each. The national winners receive £1,000 for the school and £20 each.

## Soviet campaign

SOVIET schoolchildren could soon be using BBC micro and Electrons in the classroom.

Following the announcement by the Soviet authorities to equip eight million pupils with computers in the 1985 five-year plan, the Acorn distribution company 3SL is mounting a series of promotional visits to the Soviet Union. It is also spending £50,000 in an attempt to

secure a contract for the BBC micro and technical training and assistance.

Until recently, the West has maintained an embargo on computer exports to the Soviet bloc because of U.S. fears that computers could be used for military purposes. Now the embargo has been lifted for small micros.

The lifting of the embargo has created a large new export market which several

companies, including Sinclair Research and Apple, as well as Acorn, are viewing with keen interest.

A spokesman for 3SL commented: "Chances are good for the BBC but you have to remember that the Soviet market is not the same as ours. Everything tends to be slow and complicated, so it could be a long time before any serious deal is finally concluded."

# BBC/ELECTRON PROFESSIONAL SOFTWARE

Our educational software is used in thousands of schools and homes throughout Great Britain.

## EDUCATIONAL 1

BBC/ELECTRON

Tape £8.00 Disc £10.00

Hours of fun and learning for children aged five to nine years. Animated graphics will encourage children to enjoy counting, maths, spelling, and telling the time. The tape includes six programs: MATH1, MATH2, CUBECOUNT, SHAPES, SPELL and CLOCK.

... 'An excellent mixture of games' ... Personal Software - Autumn 1983.

## EDUCATIONAL 2

BBC/ELECTRON

Tape £8.00 Disc £10.00

Although similar to Educational 1 this tape is more advanced and aimed at seven to 12 year olds. The tape includes MATH1, MATH2, AREA, MEMORY, CUBECOUNT and SPELL.

## FUN WITH NUMBERS

BBC/ELECTRON

Tape £8.00 Disc £10.00

These programs will teach and test basic counting, addition and subtraction to four to seven year olds. The tape includes COUNTING, ADDING and an arcade type game to exercise addition and subtraction. With sound and visual effects.

## FUN WITH WORDS

BBC/ELECTRON

Tape £8.00 Disc £10.00

Start your fun with alphabet puzzle, continue your play with VOWELS, learn the difference between THERE and THEIR, have games with SUFFIXES and reward yourself with a game of HANGMAN.

... 'Very good indeed' ... A&B Computing - Jan/Feb 1984.

## JIGSAW AND SLIDING PUZZLES

BBC/ELECTRON

Tape £7.95 Disc £9.95

There are two jigsaw and four sliding puzzles on a 3x3 and 4x4 grid. Each program starts off at an easy level to ensure initial success but gradually becomes harder. It helps children to develop spatial imagination and in solving problems. The tape includes: OBLONG, JIGSAW, HOUSE, NUMBERS, CLOWN and LETTERS!

## GAMES & UTILITIES

### GAMES OF LOGIC

BBC

Tape £4.95 Disc £6.95

For children and adults alike. The tape includes AUCTION, FLIP, REVERSE, TELEPATHY and HEXA 15.

... 'This package is good value' ... Acorn User - Nov 1983.

### SUPERLIFE

BBC/ELECTRON

Tape £4.95 Disc £6.95

Fast (machine code) version of a popular 'GAME OF LIFE' in a large universe.

### KATAKOMBS

BBC

Tape £5.95 Disc £7.95

The ultimate adventure game.

### UTILITIES

BBC/ELECTRON

Tape £5.95 Disc £7.95

An assortment of useful procedures and functions which can save you hours/days of programming effort: date conversion, input and validation routine, graphic routines, sort, search and many more.

# Uneasy blend of arcade and adventure games

MAKE SURE you have plenty of free time before you embark on an adventure called **Gisburne's Castle**, the first game for the BBC B and Electron from Software Communications.

A cross between an arcade game and a graphics adventure, **Gisburne's Castle** features the intrepid Robin Hood, rallying forth on a mission to rescue Maid Marion, who is held captive in his heavily-defended castle by the treacherous Guy of Gisburne.

Controlling Robin with either keys or a joystick, you start in the heart of Sherwood Forest and attempt to find your way to the castle via forest, glade, moat, log cabin and various other locations. At each one you will be assailed by large birds and what are presumably meant to be the Sheriff of Nottingham's men, armed with some strange weapon which appears to be firing bricks at our hero.

Whatever the missile, it detracts from Robin's strength at every hit. If his energy runs out the game is over but Robin can defend himself by firing at the enemy with his bow and arrow, scoring points as he does so. Having cleared a screen of all pests, he can proceed to the next location or stop to examine and possibly pick up a variety of useful objects such as food to restore his depleted energy, quivers full of arrows, keys, a rope and even an anachronistic stick of dynamite.

Dealing with the enemy, determining the route to the castle, and deciding which objects — only three are allowed at a time — will prove the most valuable requires a considerable amount of ingenuity, and there are some important lessons to be learned by trial and error. For instance, it is a good idea to finish shooting before you be-

gin sleuthing. Ambitious and carefully-produced, **Gisburne's Castle** is an absorbing game, marred only by its somewhat uneasy blend between arcade and adventure themes.

In the shooting sequences the action is slowed by the time it takes for each of Robin's victims to disintegrate before dissolving completely, and even after you have the

hang of ambushing the enemy and eliminating them speedily, you may find that a succession of repetitively similar screens at the start will discourage you from persevering until some interesting object or new location appears.

**Gisburne's Castle** is produced by Software Communications, 8 The Avenue, Eastbourne, and costs £7.95.

## Much more than child's play

A GAME featuring the Mr Men may seem to be intended for young children but **Hi Bouncer** for the BBC B needs the nimble fingers of the mature keyboard expert.

Excellent picture-book graphics and a cheerful tune lend a great deal of charm to the game, which consists of a series of screens providing Mr Bounce with various challenges. On screen one he has to secure Mr Tail's scarf by landing on it feet first, having previously avoided bumping into any of the other characters.

On screen two, where Mr Lazy is building a house, Mr Bounce has to somersault on to a seesaw; screen three has him jumping to catch fruit on a tree, and on screen four he must leap to the clouds to prevent a snowman melting; it is best not to ask how this works.

You can play the game with a joystick or with keys to

move Mr Bounce left, right and into the air. There is a 'slow' button to control the size of Mr Bounce's jumps and without it the action is difficult to master, with Mr Bounce careering into the scenery every time he hits an obstacle.

Your three lives on any particular screen may soon be lost, in which case you will have to start again.

Appealing to look at and

## Graphics redeem banality of zapping

AMONG a range of new games for the BBC B from Superior Software is **Star Striker**, a straightforward zapping game which is redeemed from banality only by its attractive graphics.

In spite of the war-like theme, **Star Striker** manages to look very attractive, with the aliens fluttering like brilliantly-coloured butterflies, splitting into two when hit, or bursting with a little shower of stars. Fairly easy at the start, the action becomes more demanding as the game progresses, providing players of all skill levels with a reasonable amount of entertainment.

**Star Striker** is available from Superior Software, Regent Street, Skinner Lane, Leeds LS7 1AX and costs £7.95.

More software page 12

Available at selected  
Spectrum (UK) and other leading  
computer outlets.

# MAKE THE BBC AN EXPERT AT COMMUNICATIONS.

The BBC Micro is unbeatable when it comes to holding your attention. But when it comes to talking to the rest of the outside world it's virtually speechless.

Until, that is, you speak to us.

In which case you and your BBC could soon be accessing viewdata systems throughout the country.

By simply linking your BBC into our purpose-designed communications and viewdata system you dramatically increase the capability of your micro. Allowing you to keep in touch with your friends. And to get answers within minutes to electronically mailed letters. You can even try your hand at the latest adventure games on Micronet 800 (as well as looking at the news, reviews, prices and best-buy information).

In addition to all this, you will also be able to access Prestel. A vast database of news and information. Helping you to book tickets for your favourite concerts. Plan your road and rail trips. And even check the weather forecast before you go.

Our communications and viewdata systems open up the world to you and your micro. And at a down-to-earth price - with systems starting from under £90.

So, if you're keen to contact the outside world... simply contact us.

APPROVED for use  
with telecommunication systems  
run by British Telecommunications  
in accordance with the conditions  
in the instructions for use.

# Olympics fails to win gold

SPORT and athletics are becoming an increasingly popular theme for computer games and it is scarcely surprising that the Olympics should provide the focus for at least one recent release.

Database Publications billed its **Micro Olympics**, available for the BBC B and the Electron, as the first software program to carry paid advertising, an ingenious way of combining both profit and extra realism in a topical and carefully-produced game.

Excellent graphics and true-to-life action are the great asset of the program. Players can choose to compete against the greatest athletes of the day in a range of events such as running from 100 to 1,500 metres, long jumping, throwing the discus or the javelin.

World records are the target to beat and the simulation of the athletes' movements is accurate and lively. Waving crowds, action replays and tongue-in-cheek news flashes, like the one reporting that the

discus thrower has collapsed from spinning round too fast, as well as those famous advertisements, all add to the fun.

Where the program suffers, however, is on playability. The fact that each category of events, whether running, jumping — including pole vaulting and high jump — or throwing, has to be loaded separately is a cumbersome arrangement.

The method of competing is also a little wearisome. In the running events, for example, the player chooses two keys to represent the left and right feet and then

punches them alternately to achieve some semblance of a running motion — scarcely a test of skill and agility. The same method applies to the throwing events, where the player chooses an angle and then runs like mad as before.

Micro Olympics will, however, make an impression on the strength of its visual appeal and topicality, if not addictiveness. The game is produced by Database Publications, Europa House, 68 Chester Road, Hazel Grove, Stockport SK7 5NY and costs £5.95 for cassette, £7.95 for disc.

## Bouncing game is exciting

RECOGNISABLE instantly to anyone who has ever played **Jumping Jack** on a Spectrum, **Bouncing Bill** for the BBC B involves negotiating a series of sliding horizontal walls to reach a basket of plums at the top.

The plums are apparently there only to give rise to a ghastly joke — your mission is to rescue these damsels in distress says the instruction screen — and the walls are unusual in that they have moving gaps.

The idea of **Bouncing Bill** is extremely simple and the graphics are rudimentary, yet the game manages to seize the attention. You must judge your leaps accurately so as not to hit your head on the next level or crash through a gap beneath you — both of which will knock you out for a few vital moments — and even when you think you are doing well, you may suddenly find yourself right back at the bottom again.

**Bouncing Bill** is available from Oak Software, 71 Woodlands Road, Hertford, Herts. It costs £4.

# Board theme lacks appeal

TWO new releases for the BBC B from Virgin Games can claim to be a little out of the ordinary, although neither is entirely successful in what it sets out to do. **Brainstorm** is billed as a game of skill and logic for two players. For some reason the authors have chosen to give what is basically a board game transferred to the screen a thoroughly unprepossessing theme; one player must try to defend his brain against a laser attack by the other player, while attempting in turn to destroy the opponent's brain.

At the start the players choose between three board layouts, each with a set pat-

tern of electro-prisms with an unknown deflection factor. The players must move their electro-prisms about the screen and attempt to fire their lasers in such a way as to wipe out the enemy brain. A number of rules govern where prisms may or may not be placed and players can vary the level of difficulty by choosing the length of time laser beams remain visible.

If you have the patience to work out the slightly obscure instructions, and if you enjoy taxing your mind, **Brainstorm** can provide a few absorbing moments but apart from the random deflection factor — and eyestrain from prolonged scrutiny of the

screen — it is difficult to see what the game offers which could not be supplied equally well by an old-fashioned games board.

**Sea Adventure** has the player adrift in the South Seas trying to return home to England via pirate ships, desert islands, sea creatures and other maritime encounters. Colourful graphics illustrate the various incidents and do much to enliven the adventure but the action is a little restricted, with a choice of directions being the option offered most frequently.

The authors boast that the use of the function keys to issue commands such as North, South, Pick up object,

Use object and so on make the player's task simpler. In fact, in the case of the direction commands, pressing N or S, as is the convention in so many adventure games, is simpler than checking the insert to see which function key represents which direction.

Having proceeded in one direction, you may reach a dead end and have to retrace your steps and that can become wearisome after a time, although the scenery as represented by the graphics may encourage you to persevere.

**Brainstorm** and **Sea Adventure** are produced by Virgin Games, 61-63 Portobello Road, London W11 3DD and cost £7.95 each.

# Caesar has successfully invaded the BBC B

ALREADY FAMILIAR to Commodore 64 and Spectrum owners, **Caesar the Cat** has now made an appearance on the BBC B, with very little difference to its previous incarnations. The most distinctive feature is the appealing cartoon-style graphics.

The title screen has our moggy hero drawing the credits with its tail and, on the next screen, he can be seen padding along the shelves of the larder while a horde of mice nibble away at

the various items of food to be found there.

The player's aim is to guide Caesar on his patrol, pouncing on the mice and taking them out through a door whenever it manages to catch one. Points are scored for each mouse despatched in that way but meanwhile they are also lost in proportion to the amount of food the mice put away.

After clearing one screen occupied by black mice, worth 300 points each, the player goes to a more difficult

level where the mice are blue and worth 500 points. The child-like graphics might lead you to think that it is an easy game but it requires a fair degree of skill and feline patience.

The mice have a habit of disappearing as soon as Caesar is on the same shelf, and when he leaps from one shelf to another in an attempt to catch them, he must be careful not to knock over any

items of crockery — disturbing the red crockery, in particular, puts an end to the game. Attractive to look at and entertaining to play, it is a thoughtfully-produced game with the only disadvantage being the time it takes to start again after losing a round.

Caesar the Cat is produced by Mirrosoft, Holborn Circus, London EC1P 1DQ and costs £6.95.

## Supreme puzzle

IF YOUR TASTE runs to infuriating puzzles which test the brain cells rather than furious arcade action which challenges the reflexes, **Gatecrasher** for the BBC B and Electron could be the game to keep you awake late into the night.

The aim is to drop 20 barrels through a maze into nine boxes at the bottom. As a barrel descends through the maze, it passes through a series of gates, altering the direction of each as it does so. If a barrel drops into a box which has already been filled, both barrels are lost.

By studying the maze carefully and by scrolling it up or down to see if a more convenient course is presented, you must try to fill each of the boxes. If you are desperate, as you may well find on occasion, you can press E for earthquake.

There are seven levels to the game, including two where you not only fill the boxes but do so in a numbered sequence.

You need 15,000 points to reach level seven and if you manage to complete that you will be given a chance to crack a secret code. To make sure you give the game your full attention, Quicksilver is

offering a prize of £200 to whoever breaks the code and has the highest score; entries must be received before December 3.

Gatecrasher is available from Quicksilver, Palmerston Park House, 13 Palmerston Road, Southampton SO1 1LL and costs £6.95.

## Classic still on top

CLASSIC ADVENTURE for the BBC B and the Electron is aptly named. First written in Fortran in the 1970s, the game is the archetypal adventure program, condensed from its original 200K to the BBC 32K.

A text-only adventure, the game features all the elements which have since be-

come the familiar staple ingredients of many other adventure programs. Starting from a wellhouse somewhere in the forest, the player must set off to find the fabulous treasure hidden in the Colossal Caves. Useful objects such as a lamp, an axe and food, and less obviously useful ones like an Eastern flute

or a black rod with a rusty star on the end of it — are strewn about as you wend your way through valley, stream or large domed hall.

Despite its venerable age, **Classic Adventure** shows no signs of tiring and should still please purists who like their adventures unadulterated by graphics. The storyline is eventful enough to make you want to keep playing and the style of the descriptions is agreeably poetic. Be warned, however, that as you follow winding paths and streams, keeping track of the changes of direction you have made will not necessarily produce an accurate map.

Classic Adventure is available from Melbourne House, Church Yard, Tring, Herts HP23 5LU and costs £6.95.

## DUCKWORTH HOME COMPUTING

### EXPLORING ADVENTURES ON THE BBC MODEL B by Peter Gerrard £6.95

This is a complete look at the fabulous world of Adventure Games for the BBC Computer. Starting with an introduction to adventures, and their early history, it takes you gently through the basic programming necessary on the BBC before you can start writing your own games.

Inputting information, room mapping, movement, vocabulary - everything required to write an adventure game is explored in detail. There follow a number of adventure scenarios, just to get you started, and finally three complete listings written specially for the BBC, which will send you off into wonderful worlds where almost anything can happen.

The three games listed in this book are available on one cassette.

### EXPLORING ADVENTURES ON THE ELECTRON

As above but for the Electron. £6.95

### BBC PROGRAMS I

Edited by Nick Hampshire

This book provides you with a range of useful and exciting programs for the BBC Micro. Games, utilities, graphics and functional programs are covered. The games include an exciting version of Star Trek, a full length adventure game, Space Invaders, Battleships, Space Blaster, Brick Blaster, and many others. Among the functional programs is a personal information retrieval package which enables you to create and manipulate up to 365 records. This is a basic book for every user of the BBC Micro.

Written by Carl Graham and edited by Nick Hampshire, publisher of Commodore Computing International. £6.95

## Fast action with lively graphics

IF YOU LIKE fast action accompanied by colourful graphics and a lively tune, **Mr Wiz** for the BBC B should fit the bill.

Your aim is to guide a wizard round a garden to eat as many cherries as he can while avoiding the attentions of a swarm of gremlins which are in hot pursuit.

Mr Wiz can fend off the gremlins by throwing his crystal ball at them, if he can turn to face them in time; or he can lead them under one of the apples scattered about the garden in the hope that they will fall on them and squash them.

There are 10 points to be earned for every bunch of

cherries the wizard eats and a bonus 1,000 for eating the magic mushroom in the middle of the maze.

Nimble reflexes are required to keep out of the way of the gremlins and the fact that the crystal ball takes a short time to recharge after it has been thrown only adds to the player's difficulties. Although you start with three lives, you may find that until you have become accustomed to the ways of the gremlins the game is over very quickly.

Examined closely, **Mr Wiz** is just another variation on the familiar Pac-man theme but it is a well-produced and challenging game which is likely to hook even the jaded keyboard expert.

**Mr Wiz** is produced by Superior Software, Regent Street, Skinner Lane, Leeds LS7 1AX and costs £7.95.

## Pinball wizard's delight

KANSAS City Systems has hardly gone to town with the packaging of its **Pinball Arcade** but behind a forbiddingly plain insert lies a well-designed and thoughtfully produced program.

The game allows you to play a straightforward computer version of the classic pinball machine game, or if you are disenchanted with that, to build a pinball board of any design you wish. The choices are almost unending — you can take the computer board and play with that or you can start from scratch and put in the bouncers, slots, numbers and other elements displayed at the side of the screen. You simply move them round with the cursor keys, pressing the space bar to pick up or fix in place.

As well as designing the layout of the board, you can alter the scoring of each element, or to speed the bounce or change the angle of the

table, and when you have finished you can save any table you have designed to tape.

The simulation of the pinball game is excellent, with the ball bouncing off the obstacles at a realistic angle and the flippers doing their job very much like the real three-dimensional variety. Only the option of shaking the whole machine to alter the course of the ball is missing but purists would not allow that anyway.

Although there seems to be no reason to play with a computer version rather than a real pinball machine, except perhaps for the rarity of the genuine article nowadays, **Pinball Arcade** manages to be a thoroughly entertaining program, thus more than justifying its existence.

It is available from Kansas City Systems, Unit 3, Sutton Springs Wood, Chesterfield and costs £10.35.

## Drumming up endless possibilities

QUICKSILVA has aimed **Drum-Kit**, a programmable rhythm synthesiser for the BBC B, at the serious musician, but if you are strictly amateur or even almost tone deaf, you should find the program fun, educational and easy to use.

The program puts the user in control of four instruments — a base drum, a snare drum, a whistling electro and sticks, which produce a blip. Each is represented by a row of 16 buttons or keys which the player can turn on or off. If an instrument key at any particular beat is on while it will play; if it is on red it will remain silent.

The method for entering the beat is simple; you use the cursor keys to move an arrow to the required key and press return. Keys are numbered and there is a 'clear' button to cancel a whole row.

The possibilities of the program are almost endless; besides combining the different instruments you can also put accents on certain beats, alter the volume of any or all of the instruments, change the tempo, and vary the number of bars or beats to the bar. There is even a facility for playing along by pressing the 'Tap' key.

Lack of volume is the main limitation to the program for anyone intending to use it in earnest and professional musicians are likely to prefer one of the more sophisticated synthesisers available on the market.

Nevertheless, this is a thoughtfully designed and reasonably priced program offering ample instruction and entertainment. An excellent, clearly explained manual is not the least of its assets.

**Drum-Kit** is available from Quicksilva, Palmerston Park House, 12 Palmerston Road, Southampton SO1 1LL. It costs £9.95.

**M**ANY PEOPLE who buy the BBC micro do so with the intention of making it help them in a business in some way. Others, having bought one, realise that beyond programming and games playing, it can help with ordinary tasks in the home, like writing letters or keeping information.

Either way, the BBC Model B is well-suited to prolonged use of packages like word processors, databases and spreadsheets by virtue of its full-sized keyboard, multiplicity of screen modes and its variety of display outputs to domestic TVs or monitors.

A printer is essential for business use and one or more disc drives could be added to the system, although they are by no means vital, as many of the business programs available for the BBC micro will work with cassettes as well.

A small set-up could be used to word-process letters, cope with accounts and invoicing or predict the cashflow in a business, and can also help a club secretary to do mailshots to members.

Software which extends the use of a BBC micro into the small business or self-employed environment falls roughly into five categories — word processors, spreadsheets, accounting, databases and, finally, software to perform such operations as invoicing, stock control and order processing. The tendency now is for several of those programs to be linked, making the whole system more versatile.

Software is supplied for the BBC micro in three forms — on cassette, on

# Getting down to business

## Clive Williamson examines BBC software for the home and office

puter Concepts was the first and is still the most popular at £46. It was written with the inexperienced user in mind and works from a simple selection of menu options. The Acornsoft **View** is more complex to use and more expensive at £59.80 but is capable of rather more advanced operations.

A feature found on professional word processing systems is the ability to link with external data such as names and addresses to produce standard letters from a single text file but until now neither of the aforementioned programs has been able to do that. Fortunately, things are changing and the new **Database** program from Acornsoft can create special files of data to give **View** owners a simple standard letters facility. Prices are £11.90 for the cassette version and £15.35 for the disc. Other manufacturers are also working on software for this useful function.

A database is a means of storing large amounts of information so that it can be retrieved quickly, having been edited, sorted or searched for specific data. Maintaining a large database usually

in the file who lives in Surrey. An example of a database of this type is **Mailist** by Gemini Marketing which sells for £19.95 on cassette or £23.95 on disc and is extremely useful for clubs or companies needing to do simple mailshots. A similar program is included in the Acornsoft **Desk Diary**, which is a combination of planning diary and address book on one cassette for £9.95.

A more complex form of database permits the users to set up or configure the format of their own data storage. Data such as catalogues, recipes, personnel or medical records, or product information can be held in files created to the user's requirements. Databases of this type are best run with one or more disc drives, which can allow much larger files to be created than with cassettes.

The **Clare Betabase** is for disc use only, is a very versatile program, and is good value at £25, while the already-mentioned Acornsoft **Database** costs £15.35 for the disc version and can be used in conjunction with **View**.

Even more advanced databases are available now in ROM form. The powerful Gemini **Datagem** program is two ROMs mounted on their own printed circuit board and at more than £100 it is also beyond most people's pockets. It is aimed squarely at business and educational users of the BBC micro, hence the high price tag.

More reasonably priced is the **Starbase** ROM marketed by GCC of Cambridge for £69. It has some very pleasant features, including the ability to manipulate information in the database to generate customised printed reports and, like **Betabase**, it has a large storage capacity which is limited only by the type of disc drive in use. **Starbase** can have only one Mode 7 screenful per record, while the individual records in **Datagem** can be much bigger.

The database structure is also at the heart of many packages which can be used to handle the day-to-day running of a small business and there are two suites of this type of software available for the BBC micro. One is by Acornsoft — its **Mirle** modular business software

## 'The tendency now is for several of those programs to be linked'

disc or as a plug-in ROM chip. The latter has the advantage that a long program can be installed permanently in the micro, taking up none of the machine memory until it is called-up. It then works as a language in its own right, replacing Basic. A simple **^^** command is all that is needed to make one of these chips run instantly, with no delay while the program is loaded. While they are more efficient, programs in ROM tend to be expensive items; discs are often much cheaper and cassettes cheaper still.

The single most useful piece of software which can transform a micro from a programmable toy into a professional tool is a word processor. Several are available for the BBC machine and most are ROM-based. **Wordwise** from Com-

takes up a good deal of time, so this form of information storage is really useful in business terms only if the data can be made available to a number of people, or if the searching and sorting for specific references make the system cost-effective. Those factors sometimes make a database unsuitable for the home environment, as it can be quicker to write the information on file cards and refer to it by hand.

The simplest database is something like a mailing list, which holds a number of names and addresses and can print them out on a series of sticky labels. Data can be added or deleted from the file of information and usually can be sorted into some kind of order — e.g., numerically or alphabetically — or selected in some way — e.g., everyone

range — which is disc-based and enables the user to buy one module at a time.

The full list is invoicing, order processing, accounts receivable, accounts payable, stock control, purchasing and mailing system. Each £24.95 program can be linked to others in the range, so that information from one updates files in the others automatically. A second range is available from Gemini — its integrated accounting programs for the 32K BBC micro. These modules are £99.95 each and the titles are stock control, invoicing and sales ledger, purchase ledger, nominal ledger and payroll.

If you are considering spending a large amount on software of this kind, it is advisable to study its specifications well and, if possible, see it running first to make sure that it really does the things you want it to do.

A spreadsheet is a program for performing masses of inter-related calculations, making it ideal for tasks such as cashflow analysis or financial modelling, scientific tables and accounting. Once a sheet has been defined, its contents can be saved, usually on to tape or disc, or printed-out to provide a permanent record of the results.

The spreadsheet is a large two-dimensional matrix or grid of cells held in the computer memory, every cell on the sheet having its own grid reference. Each vertical column is identified by one or more letters of the alphabet, while each horizontal row is given a number. Each cell may contain text, a numerical value or a formula which

enables calculations to be carried-out using the contents of other cells.

The formulae are not visible in the cells but the results they produce are. There is always some way of moving the cursor from cell to cell, so that each location can be inspected or edited and it is at that stage that the formulae become visible.

The overall size of a spreadsheet is dependent on the amount of memory available in the computer but is typically 100 cells wide by 200 down. The screen acts as a window which can be moved to see different areas of the grid. The factor limiting the amount of data which can be held by the spreadsheet is the memory remaining after the sheet

My favourite here is the Gemini offering, which has a pleasant, colourful Mode 7 presentation and gives most of the essential spreadsheet facilities. It is slow, though, being a Basic program, whereas the more workmanlike Vu-Calc responds very quickly to commands as it is written in machine code.

More ambitious spreadsheet programs are the BBC Soft **UltraCalc** and **Viewsheet** by Acornsoft, both plug-in ROMs, which are modelled on professional packages and have a big range of features. At around £80, **UltraCalc** is the more expensive of the two, having marginally better mathematical functions and facilities for setting-up complex sheets and easily-remembered

## 'Vu-Calc responds very quickly as it is written in machine code'

has been defined by the software and for that reason those sheets available as plug-in ROMs are capable of supporting a larger matrix and can therefore perform much more complex calculations.

Two inexpensive spreadsheets are available for the BBC micro which are suitable for disc or cassette use — **Vu-Calc** by Psion and **Spreadsheet Analysis**, another Gemini product. Both are fairly easy to master and the latter can be used with a second program — **Graph Plot** — to generate pie-charts and bar-graph displays from the calculated results.

mnemonics for its commands, but it works only in Mode 7.

**Viewsheet**, on the other hand, makes full use of the BBC micro function keys and can operate in any of the BBC screen modes, including the 80-column modes 0 and 3. Selling for £59.80, **Viewsheet** has the added advantages that it can be set up to display different areas of a large sheet on screen at the same time and it can also generate an output which can be used directly by word processors such as **View** and **Wordwise** when writing reports.

Many of the programs essential to running a small business are now included free with the Z-80 second processor for the BBC model B which is complete with word processor, spreadsheet with graphics output, database and an accounting program. Also in the bundle of software is a program for customising your own databases, as well as two versions of Basic, plus **CIS-Cobol**, a business-orientated language.

All the programs run under **CP/M**, the operating system used by many of the major commercial packages available for big-league business micros, and the Z-80 processor has been developed by Acorn as a way of running those existing packages on the BBC.

The whole processor/software bundle costs £299, which sounds expensive but is incredible value considering the value of the free software. The only snag is that you must have disc drives.

Whether you buy a word processor chip, a simple database or an expensive set of linked programs to run in a small business, the BBC micro can assist with an enormous range of tasks in the home or a small-scale business environment.

# The invasion has begun... for BBC Model B

# Real pleasure in BBC deal

In the first of a new series, Chris Naylor considers the new Acorn contract

SAY what you will, from a journalist's point of view it made good copy. It had drama, intrigue — and millions of pounds were at stake. The existence of certain computer companies might have depended on the outcome. That is why representatives of magazines and newspapers waited with bated breath for one of the hottest contracts in the microworld, the lucrative, make or break contract with the BBC.

In late 1981 the BBC signed a contract with Acorn Computers, under the terms of which Acorn was allowed to refer to its machine as the BBC computer. In return for the privilege, Acorn paid the BBC a fee on each such machine sold. At the same time the BBC developed and screened *The Computer Programme*, the first programme in its computer literacy series, and the big star of the show was the new BBC machine.

At the time, Acorn was reasonably successful financially but it was by no means in the big league of computer firms. Neither was it at all certain that the BBC contract would place it in the big league. Initial estimates in 1981 suggested that the demand for the BBC micro might be some 12,000 machines a year — according to the BBC — or, more optimistically, 17,000 a year, according to Acorn.

The cheapest Model A cost £299 and who, in 1981, could reckon on many people wanting to part with almost £300 for what was, after all, only a computer? For that kind of money it was possible to buy a dishwasher and, say what you like, at least everyone knows what a dishwasher does.

Now, in 1984, more than 350,000 machines have been sold. Production is running at 25,000 machines per month, twice the estimated initial annual production — and Acorn has been floated on the Unlisted Securities Market with a value on it of £150 million, putting it firmly in the big league in the U.K. computer world alongside such giants as ICL, Britain's biggest mainframe computer company.

Despite its 20-year existence, the

value of ICL, prior to its recent merger with Standard Telephone and Cables, was probably little more than twice that of Acorn, which demonstrates clearly that the growth of Acorn has been phenomenal in anybody's terms.

Tom Hohenberg, Acorn marketing manager, admits that the BBC contract helped Acorn enormously: "There is no way," he says, "that we could have sold so many machines without the BBC name," which is a fair and generous comment.

Less generous have been the comments from firms which have not benefited from the BBC connection. At various times several micro makers announced their intention to be in the running when the BBC contract was due for renewal, including Dragon, Computers and, of course, Sinclair Research.

At last the waiting is over. The contract was placed. The BBC was "pleased to announce that a contract has been signed extending the agreement with Acorn Computers for the manufacture and distribution of the BBC microcomputer for a further four-

SIGNING THE AGREEMENT: From left to right: Hermann Hauser, Chris Curry, Bryon Parkin, managing director BBC Enterprises, and Bill Cotton, chairman.

receives its fee from Acorn without having to do anything. Neither party will indicate the terms of the deal but nobody is denying that the BBC must have collected some £6 million from its licence fee on Acorn machines.

To put that in perspective, one of the BBC's money-spinners is *Radio Times*, a magazine which falls into the best-seller class. In the year to April 1983 profit from *Radio Times* was £5.6 million on a turnover of £45.2 million.

That means that the contract with Acorn is worth more to the BBC than *Radio Times* and, to receive the Acorn money, the BBC does not have to go to the trouble of publishing a magazine. All it has to do is to receive the cheques.

Look at it another way. The licensing of the BBC name and similar commercial enterprises is handled by BBC

## 'The contract with Acorn is worth more to the BBC than the *Radio Times*'

year period from September 1, 1984."

The one fact which appears to be generally overlooked, though, is that when the BBC used the word "pleased" in making its announcement it was not just being polite — it must have been grinning from ear to ear with pleasure. For there was never any real doubt that the contract would go again to Acorn and the real reason for that is, as much as anything, the pleasure the deal gives, not to Acorn, but to the BBC.

Commonly, other firms tend to look at the BBC contract "as a licence to print money," says Hohenberg. "They talk as if the BBC bought the machines but they do not." Acorn gets the benefit of the BBC name and the enormous publicity derived from every screening of *The Computer Programme*. The BBC

Enterprises Ltd. So it is BBC Enterprises Ltd which receives the cheques. In the year to April, 1983 the turnover of BBC Enterprises Ltd was £26.1 million, with no profit recorded. Take away the Acorn contribution and it becomes apparent that, were it not for the contract with Acorn, BBC Enterprises Ltd could have run into the red.

Has the BBC contract been a licence to print money? Probably it has, but not only for Acorn — it has been manna for the BBC, too. With a deal like that, who in their right mind could have thought that the BBC would want to go elsewhere?

It was with real pleasure, not the simulated kind, that the BBC announced the renewal of the contract and who can blame it?

# REGARDEZ

LANGUAGE LEARNING AIDS FOR  
FRENCH, GERMAN & SPANISH

FOR BBC(32K) • ELECTRON  
SPECTRUM (48K)

As used in numerous schools and colleges these programs provide a highly successful aid to modern language learning. Each cassette contains a sophisticated control program and a comprehensive series of vocabulary lessons which can be used in a variety of self-paced learning and test modes. Words, phrases etc are displayed with all necessary accents and special characters, different colours are used for masculine, feminine and neutral words to assist gender learning.

The programs are suitable for beginners, level and beyond as simple commands enable new lessons in vocabulary or grammar to be created by the user, edited as required, then permanently saved for later use. Invaluable for homework and exam revision!

Two cassettes are available for each language, together these contain a vocabulary of thousands of words. Level A provides 16 lessons in general subjects. Level B provides a further 16 lessons including adjectives, adverbs and fully conjugated verb lists.

Available from your computer store or by mail order Price \$9.95

# Micro fails to make the grade

**B**AD MARKS for maths programs said a headline in the *Acorn Programs* June issue. The report concerned the fact that the Mathematical Association, one of Britain's professional organisations for teachers, had found some fairly serious errors in BBC software supplied free to schools by the Government. That headline was echoed in a number of periodicals, there being undercurrents of glee in almost all the reports.

My first reaction was glee, too. The glee did not, however, indicate a feeling of superiority that I could have done better. Rather it was a kind of I told you so reaction, one of relief almost that not even Government-sponsored, high-cost learning software can hit the mark.

I have been involved in educational software development and in writing about learning with micros for a number of years. The former activity has led me to two major conclusions. The first is that, defining an educational program on the basis of the kind of product which is now swamping the market, we need something like one million learning software packages before we can reckon to have covered the needs of home and school learners between the ages of five and 16 — in Britain those ages mark the limits of compulsory formal schooling.

That mind-boggling total is neither a misprint nor the result of miscounting on my part. I must point out that I have gone through the calculation in print and in public a number of times and never had it queried. In essence, the

## Schools software could do better says Eric Deeson

recalling the fact that no single child at secondary level covers all the syllabuses offered in any school. Most schools allow a choice of four or five options subjects from 20 or more.

A factor of about 10 now enters the calculation to cover at least in part the need to allow for the differing abilities and backgrounds of children and the different approaches teachers may want. A concept such as adding vectors, for instance, would need different approaches for less able and high-flying children, and for physics and mathematics syllabuses.

It would need different approaches for someone meeting the subject for the

learning but the giants of the past — the Apples and TRS-80s — will no doubt be replaced by new undreamed-of systems before the end of the decade.

I shall labour the point of those million programs. Clearly the work will never be completed, if indeed we ever set ourselves that task of meeting all formal learning objectives to age 16 by way of micro software. Certainly many people are looking forward rather to intelligent systems which know how to teach and can draw on the proper subset of human knowledge for a given learner at a given moment.

Certainly, too, others are looking to multi-purpose software systems into which teachers can breathe some undefined essence of fact and fancy the night before 3C pupils sit down with their micros and turn to Program 1047d. Yet others look to the logical endpoint of the information revolution and prepare to welcome the day when our masters throw factual examinations out of the window.

Who knows which of those will arrive to save us the task of preparing a million learning programs? Certain it is, though, that literally hundreds of software houses are desperately publishing so-called educational programs as if their lives depended on it, as indeed they may do, whether they were conceived in teachers' midnight-oil garrets or in the plush boardrooms of long-established book publishers.

The second claim is that there is no such thing as a perfect learning program. The glee which welcomed that Mathematical Association report on the costly Government-backed software was simply a sigh of relief that company X, faced with a poor review, could now state that not even flagship programs were perfect.

Yet can there be such a thing as a perfect learning program? Can anyone conceive a package of software which can be used with ease by any suitable learner, without problems for the supervising parent or teacher, and which deals with the topic in question without error, without chance of boredom, without being too fast or too slow?

I do not think the answer to those questions can be in the affirmative, but in saying that I at once throw down the gauntlet to those hundreds of software houses. Can they send us one of their programs and claim that it is perfect in meeting its stated aims and objectives

*continued on page 22*

## 'Most teachers know little about the wide field of computers in society'

argument is that a learning program is one which covers a single topic or skill in such a way that the user can spend perhaps an hour or two with it, without getting bored, and end with new understanding and consolidated knowledge. Such a program, properly supported as required by print materials, is as valid for use at home as at school.

The formal school career of a typical British youngster comprises some 10,000 hours in the classroom. If, on average, he picks up one topic or skill each hour, we would need 10,000 programs to provide for those learning objectives.

We can double the figure at once by

first time and for someone else looking at it in the light of last-minute revision requirements. It would need different approaches depending on whether the learner knew little geometry or had a clear concept of vectors as mathematical entities. The home learner might require something other than would a youngster at school with a teacher to hand, and so on.

That brings us to 200,000 learning programs. It is simple to step from there to the million mark by recalling the number of different hardware systems in use. The Acorns, Commodores and Sinclairs are at the moment the main machines involved in home and school

with learners in a stated category, and in being a model of communication as defined by current learning psychology thinking?

I remind myself of a secondary school chemistry textbook which after 40 years and dozens of editions contained an unreported error until a few years ago; and of a sixth-form physics textbook, also with sales past the million mark, with six mistakes in the latest edition.

I think of learning software for the BBC micro with screen after screen of undiluted text — all in capital letters and without full stops; and other programs which do not utilise colour and sound in any really communicative way, plus others again which respond "No, that is wrong," after every single incorrect response.

While micro technology is far from the state at which a system could conceivably model the approaches and behaviour patterns of a real teacher — compassion and patience, flexibility and humour, real-life links and references to related concepts in other topics — one must wonder at the view of education held by so many writers of learning programs.

Even though most primary schools have at least one micro and secondary schools have on average four or five, computers do not affect by one jot the classroom work of the vast majority of teachers and pupils. If that is news to you, ask a sample child or two. If it amazes you, stop and think about the logistics of sharing hardware at the rate of one micro/display/backing store per 250 children — nine classes — in the light of the teacher's busy day, the

staircases which fill most schools and the rarity of classroom power points.

If your child spends two hours on a learning program or two on your home BBC, he or she will probably learn more with the new technology than in a year at school.

So in what ways are micros, in theory, used in our schools? One can break down educational computing into several distinct categories. Computer awareness is often called information technology in school prospectuses and timetables. Its aim is to maximise children's familiarity with computers in the world as a whole — their use, their uses, their abuses. Many schools include at least a few hours of such work in various kinds of general course followed by all pupils. Not only is a computer not needed in that kind of work — a school micro on the teacher's desk can interfere with the kind of learning for life which is to take place.

The reasons are that most teachers know little about the wide field of computers in society and that so far there is almost no relevant software to aid the demonstration of principles. Another message to software houses: let us have some good computer awareness simulations — booking systems, police-style databases, banking software. Almost all we have so far is the Tecmedia **Edfax**, a DIY teletext simulator.

In computer studies, the computer is the apparatus used in formal examination-based computer science teaching. In the last few years the number of candidates for examinations like CSE and GCE — the main British public examinations at around age 16 — have grown enormously and have flung the

subject well and truly into the top 10.

It is almost possible to teach courses like that without a micro in the classroom; some schools still do so, with success. Yet computer power of some kind is essential and it fulfils two needs. The first is computer awareness as I defined it — and where the teacher's needs are as desperate as I said; the second is for the pupils to learn the elements of programming where the need is for good sample software.

That "good sample software" has to show originality of purpose, a thoughtful use of coding techniques at different levels, and structure from the purists' entirely valid point of view.

Again, such software does not exist, though it is the area which uses most computer time in all secondary schools and that is the area in which the use of the home micro can do most good.

Computer-assisted learning is the field I had in mind when talking about one million programs. The computer joins chalkboard, textbook and projector as one of the many resources available to maximise the effectiveness of teaching in almost all subject areas at all levels. Many teachers do not use textbooks — they do not like them and/or they cannot afford them; many more do not use projectors — they fear electrical equipment and/or they cannot afford the software; and the vast majority do not use computers for the same kinds of reason.

If we want micros to be able to help every subject-based classroom need, that is where we want those million programs, and that is where all those software publishers are concentrating their dreams of riches.

Of the 200,000 programs we need for the BBC, we have now perhaps a thousand or even two. The spread is poor, however, there being dozens of packages helping with the rote learning of multiplication tables and dozens more offering to drill the hapless youngster in simple French vocabulary.

They are the programs which are

**Amplisoft**, 31 Woodbridge Road, Derby Green, Blackwater, Camberley, Surrey — a new entrant to the field with some interesting potential, so far too early to assess.

**AVC Software**, PO Box 415, Harborne, Birmingham B17 9TT — a number of Electron and BBC programs, mainly drills for the 8-13 age range but also a popular simple version of turtle Logo.

**Beebugsoft**, PO Box 109, High Wycombe, Bucks — Paintbox, Masterfile and other valuable relevant utilities.

**Bourne Educational Software**, Bourne House, The Hundred, Romsey, Hampshire SO5 8BY — a prolific publisher with some good products.

**Chalksoft**, 37 Willowslea Road, Worcester WR3 7QP — a good and growing range, though rather uneven in quality.

**Clywd Technics**, 48 Antelope Estate, Rhymwyn, near Mold, Clywd CH7 5JH — **Edword**, a text-processing package designed for school use.

**Computer Concepts**, 16 Wayside, Chipfield, Herts WD4 9JL — **Wordwise** and other fine utilities.

**Golem**, 77 Quiltras, Bracknell, Berkshire RG12 4QG — another new company with some interesting-sounding products.

**Griffin Software**, Ealing Road, Alperon, Middlesex HA8 1JH — a good list of educational programs, mainly at secondary level.

**Heinemann Computers**, 22 Bedford Square, London WC1B 3HH — several invaluable packages, particularly in secondary mathematics.

**Kosmos Software**, 1 Pilgrim's Close, Harlington, Dunstable, Beds LU5 6LX — a newcomer to the scene with rather heavy foreign language drills.

**Longman Software**, Burnt Mill, Harlow, Essex CM20 2JE — a major publisher, long in the field but only now beginning to hit the mark.

**MUSE**, PO Box 43, Hull HU1 2HD — the world's biggest range of educational software, with much for the BBC — all levels, many subjects.

**Shiva Software**, 64 Welsh Row, Nantwich, Cheshire CW5 5ES — a highly-appreciated range of learning programs, mainly for younger children.

**Tecmedia**, 5 Granby Street, Loughborough, Leics LE11 3DU — **EdFax**, a superb model teletext system, good for school newspapers and such.

**4MAT Educational Software**, Linden Lea, Rock Park, Barnstaple, Devon — some novel educational games.

appearing, however, and the ones we shall be reviewing. They are the programs parents have to select for their unfortunate offspring, because they are the only ones which reach the software shelves. I hope we shall be able to say something different in two years.

In administration I see the computer as helping run a school in just the same way as it helps run the day-to-day and year-to-year work of any other complex business. That field can clearly be of no interest to parents but we shall be reviewing products as they appear from school management point of view.

Here the concern of published software is school accounts, calendar organisation, time-tabling options system development and such. It is a field where much is still to be done but where, as yet, the interest of schools is not particularly high because they have insufficient hardware.

Having said that educational administration software is not of interest to home users, I must observe one category where one could argue that that is not the case. I am thinking of text-processing software as used outside the school office and staffroom and outside the commerce, business and office practice departments. Some teachers claim that every child should learn to use a computer as a text processor, to im-

prove the preparation of stories, compositions and essays in all contexts.

Computer Concepts' **Wordwise** is the front-runner, being as pleasant to use for a child's history essay as for any other task. In fact, it is not so good in office practice departments.

You may have seen **Edword**, published by Clwyd Technics specially for the schools market in which it has a number of clear advantages. I would still reckon that home users should stay with **Wordwise**, even if most of the home-work is homework.

Data capture and process control is an area where educational software is almost restricted to school rather than home use. The concern is interfacing the BBC with specialist equipment in the science laboratory, the craft/design/technology workshop, the audio-visual studio and the gymnasium. While interfacing and robotics are, of course, areas of great interest to the home hobbyist, their educational benefits are not often direct other than to help the young explorer gain experience and expertise in certain skills.

In schools, on the other hand, we can think of linking a micro to meters, oscilloscopes, recording devices, lathes, greenhouse environmental control systems, projectors and fencing hit-registers. Such applications are all specific to

group work in specialist subject departments.

There are more uses. Some may fit approximately into one or other of my five main categories. Others are important but difficult to classify. We may think of the crucial work of school computing clubs which can keep teachers and caretakers on their toes from 7.30 a.m. to 8 p.m. Or of pure gaming — not the same as educational gaming — in those clubs, in awareness classes and for raising cash on Open Days and during parent/teacher association gatherings; and of the embryonic businesses which use school equipment, electricity and expertise to break into the ever-expanding software and add-on market.

In this context of preparing to review educational software, those areas are likely not to figure largely. I offer a list, with little comment, of the major publishers in the field. The products of most can be brought from retail outlets but mail order is safe with them all. Note that many also have products for other micros than the Electron and BBC, so you will need to state clearly what you want when you order.

● Eric Deeson heads the computing department in a Birmingham sixth-form college, is editor of the magazine *Computers in Schools* and wrote *The BBC Micro in Education*, published by Shiva.

# CLEARLY HE HAD ONLY ONE KEYBOARD IN MIND WHEN HE DESIGNED THE HUMAN HAND

## IMAGINE A KEYBOARD

... so simple to use that in under an hour you're touch typing the entire alphabet, numbers and punctuation.

... so effortless it needs only one hand, your eyes never leaving the screen or the document you're copying.

A keyboard you can hold in your palm, and yet, so powerful, it can replace every input, command and function key of your BBC computer ...

Just think how effortless it would be if you could touch type your programs, data and text.

How you could lean back and relax; be faster and more accurate; your mind free to think, and your eyes to read.

## IT'S CALLED **QUINKEY**

And for **£49.95** you'll get everything you need — hardware and software — to use Quinkey with your BBC computer.

## HOW CAN 6 KEYS DO THE WORK OF 72?

You simply press the keys in different combinations. Each combination represents a character.

Quinkey has 5 keys plus a Control key, each finger belonging to its own key — so there's no need to hunt and peck ... BUT ...

## ... HERE'S THE MAGIC!

Look at these diagrams:

See how the lines joining the key combinations form the characters? For each letter there's an instantly recognised and easily memorised visual clue.

That's the trick — and it works!

## YOU CAN TRY IT NOW!

Rest the fingers of your right hand on a table top. Imagine the keys.

To write an "I" you press your Thumb and Index finger down at the same time.

For an "L" you press your Thumb, Index and Little fingers.

To write "Y" you use your Thumb, Middle and Ring fingers... and so on.

That's all there is to it.

Here's what users are saying about the keyboard:

—PETER RODWELL (as Editor of 'Personal Computer World') "took me half an hour to learn the alphabet... far easier than learning to type. It's an addictive device, and I'm starting to wonder how I ever managed without one."

—PETER WHEELER (in the 'Times Educational Supplement') "a new user can start to touch type after one hour's usage."

—FRANK DALE (BBC Producer — writing in 'Electronic Times') "no other machine is so easy to use, so easy to learn, so generally useful..."

## NO RISK, MONEY BACK GUARANTEE.

If you're unhappy with your Quinkey just return it within two weeks for a full and courteous refund.

**ONLY £49.95** (including VAT and postage & packing).  
**HERE'S WHAT YOU GET.**

- ★ One Quinkey keyboard.
- ★ Breakthrough multi-channel interface for up to four keyboards (plug into analogue port).
- ★ Two new powerful software packages, PROG & WP (described below).
- ★ Comprehensive Quinkey manual.

"PROG" and "WP" (free with the Quinkey package) are utility programs written specially for the BBC.

"PROG" enables your BBC to recognise and interpret the signals from the Quinkey keyboard. It combines easily with your application programs enabling you to use Quinkey as a comprehensive alternative keyboard.

"WP" optimises Quinkey to work with word-processing packages "Wordwise", "View" and "Edword" — a perfect text-writing combination.

## KEYBOARD RANGE.

All BBC "B" keyboard inputs generate from the Quinkey, except the hard-wire key, "Break."

### TECHNICAL DATA:

Loading length: 6605. Running length: 6300.

# QUINKEY

THE BEST IDEA SINCE THE HUMAN HAND

ONE of the best-selling pieces of software for the BBC micro is not, as you might expect, an arcade game or even an educational program but a word processing chip called **Wordwise**. Since it appeared in November 1982, the £46 ROM has sold roughly 35,000 copies, a feat many far more modestly-priced programs would envy. It has also founded the fortunes of Computer Concepts, a flourishing little company known as the specialist in ROM-based software for the BBC micro.

The man behind both the business and the program is Charles Moir, a retiring 24-year-old without any formal training in programming. Because of the pressures of running his business, Wordwise has so far remained his only major attempt at software authorship.

Moir left public school at Oundle with one A level in physics, having dropped out of both his mathematics and chemistry courses. To add to his meagre qualifications, Moir had a keen interest in electronics and only the vaguest idea of what he wanted to do in life. To pass the time, he worked for a period in his father's acoustical engineering firm.

Moir's future began to take shape in 1979 when he bought a Nascom 1 in kit form for £125. "It had to be programmed in machine code, so I learned the hard way," Moir says. Soon afterwards, he graduated to an Atom and began to think about Wordwise.

"A word processor seemed the obvious choice," he explains. "Also, I knew people who worked at Acorn and had a fair idea of what the BBC micro would be like before anyone had seen it. That gave us a great advantage."

It took Moir nearly nine months to write the program, although he says it could easily have been done in three. "I'm very lazy," he says, "and much as I like programming, it can be incredibly tedious at times."

From the start, Moir decided to make his word processor ROM-based, rather than produce it on a disc or cassette, for two reasons. "One was to make the most of the exceptional capacity of the BBC to take extra ROM chips, 16 with an expansion board, and four without," he says. "The other was that a ROM would not use any of the limited memory store of the machine." The program was based mainly on the word processor then available for the TXED research machine, considered a standard in educational circles.

"There was nothing particularly complicated about writing the program," Moir says, "apart from making

# Wise words of a top programmer

**Nicole Segre talks to Charles Moir, author of a best-selling ROM**

sure at the start that it would not go over-size. Where I did spend a good deal of effort, however, was in making the program user-friendly. I wanted anyone to be able to use it, even if they had never seen a computer in their lives."

There is no doubt that the user-friendliness and simplicity of Wordwise has been the major factor in its success. Unlike the TXED word processor, which Moir describes as having "horrible combinations of all kinds of keys", Wordwise is menu-driven to perform simple operations such as save, load, insert, and search and replace, and the manual is praised frequently as a model of clarity.

"Of all the word processors, including WordStar, the most popular CPM-based business processor, or View from Acornsoft, ours is the one which appeals most to the non-professional," Moir says. Confirmation of this can be seen in the fact that Wordwise is still selling at a steady rate of about 7,000-8,000 copies each week.

The success of Wordwise enabled Moir to look forwards into new products. Among them are one or two games, notably **Android Attack**, but early this year Moir sold all the company's games to GTM Computers. "Games are becoming very competitive," Moir says. "You have to sell too many of them to make the effort worthwhile, especially if prices are to fall, as I am sure they are. I would prefer not to be involved in that side of the market."

Since the first timid advertisements appeared for Wordwise, Computer Concepts has released nine ROM-based programs, putting the company way ahead in its field. "There are only about four or five other ROMs for the BBC on the market," Moir says, "and none is as good as ours."

The range of products includes **Gremlin**, a utility to help debugging machine code programs; **Disc Doctor**, which adds a variety of new facilities to disc drive operations; and a graphics extension ROM putting complex designs within the reach of even inexperienced programmers.

"Acorn has always promised that it would be producing a graphics ROM but so far it has not done so," Moir says. "That is one of the great things about Acorn; it takes it ages to produce anything, even though it employs something like 260 people, so we can always be ahead."

Moir thinks the real future now lies with communications ROMs. He has already produced **Communicator** and **Termi R**, connecting the BBC micro

to other computers, including mainframes, and turning it into a terminal. Although the ROMs can link into electronic mail systems, they do not connect to Prestel or other viewdata systems, but Moir regards that as the next step.

"There is no mass market yet," he says, "but if British Telecom manages to get its prices right, communications may well be the consumer boom of the future."

He thinks that Telecom Gold, rather than Prestel, will be the real winner. "Prestel is satisfactory for information but Telecom Gold, which is aimed purely at businessmen, is an inexpensive way of providing an electronic mail system to a world-wide network. A ROM enabling people to link into the system could have huge potential."

Moir runs Computer Concepts from his home, until recently a large, lawning house at Chipperfield, and now an even bigger house at Hemel Hempstead. The firm comprises Moir and six helpers, as well as several outside programmers. Most of them are local schoolboys whom Moir has instructed in what he wants, or people who have submitted their work out of the blue. Two of them, he says, are "absolute naturals", who are managing to earn considerable amounts of money from programming while still working for their A levels.

Besides programming talent, Moir feels that several other factors are important in contributing to the success of the company. One is that it has established itself as a supplier of ROM software long before anyone else. As a result, it has acquired the greatest experience in obtaining, duplicating and packaging chips, and has also developed a distinctive house style.

Most of all, Moir says, Computer Concepts prides itself on its manuals, which aim to make every product accessible to the most uninitiated customer.

"We should have a full-time manual

writer," Moir says, "but so far we have just made the programmer explain his program and then all of us, including various friends and my Mum, have read his notes and made comments until we think we have the right combination. The difficulty is in getting the manual to seem neither too simple, which would seem patronising, nor too complicated."

The only fly in the ointment at present is the rising price of the chips on which the company's existence depends. Moir attributes the present chip shortage to the huge numbers of personal computers being built by IBM, which he thinks is using more than a fair share of the world's supply of chips. He is paying three times what each chip cost only a few months ago and if prices rise further, he would have to increase the prices of his ROMs, a prospect he does not relish.

In other respects, he says, the future is rosy, even though he cannot look more than two years ahead. "This business moves so fast; who knows where we will be in five years time?" he asks. One thing, however, seems likely and that is that although all the software he has produced so far has been for the BBC, he will probably soon start looking at other machines.

"The BBC is an excellent customer," he says, "but in its present form, its days are numbered. It will soon seem dated compared to some of the newer products on the market."

Moir is particularly attracted to the QL, even though he thinks its launch was a little hasty. Also, he says the amount of software accompanying the machine makes it scarcely worth producing more. "There may, however, be scope for a ROM-based language," he thinks.

In the meantime, he is busy working on a full BBC Basic compiler and a Logo interpreter, another product promised by Acorn which so far has not materialised.

Moir works at all kinds of strange times, as well as during normal office hours, and as a result finds little time for programming of his own.

"When you have just finished a program," he says, "you think you never want to look at another but eventually the urge returns. Nowadays, I have the chance to write only the odd routine or part of a program, but I would really love to be able to do another major one of my own."

If he does and if it proves as successful as Wordwise, Charles Moir and Computer Concepts together can scarcely go wrong.

**Second Edition  
Just published**

**THE GOOD  
COMPUTING  
BOOK FOR  
BEGINNERS**

PLUS a complete glossary of computer terms

If you want to know  
about computing . . .

# THE FACTS DON'T HAVE TO BE BORING!

An entertaining, but **thorough** reference source with the most readable, comprehensive glossary you'll find anywhere. The Good Computing Book for Beginners is an essential A-Z of all the facts you need to know about computing — and none you don't!

Whether you're brand new to computing, or an old hand keen to stay ahead, you'll score by keeping this classic, top-selling book within reach to use again and again.

The author, Dennis Jarrett, is a successful journalist who was also founder editor of Which Computer? magazine — so his first edition quickly became a standard work. Now this new, substantially enlarged and revised edition covers the latest trends, terms and technology with the relevant facts — and **ONLY** the relevant facts — in **plain English**.

Here's another fact you'll find fascinating: **it will only cost you £2.95!**

Use the coupon below to get your copy right away — or buy it soon from your bookshop. It's the no-nonsense book you'll turn to again and again.

Please send me \_\_\_\_\_ copy(ies) of The Good Computing Book for Beginners by Dennis Jarrett at £2.95 each plus 50p post and packing. I enclose a cheque for \_\_\_\_\_ / Please debit my credit card account Visa/Access/Diners/Amex number \_\_\_\_\_

# CAN YOU CRACK THE CODE?

WHETHER you own an Electron or a BBC, there is a super prize to be won in our special competition to celebrate the launch of *Acorn Programs* as a monthly publication.

The first correct entry from an Electron owner wins the recently released PLUS-1 expansion unit. Worth £59.90 in the shops, the PLUS-1 adds a centronics-compatible printer interface, a joystick port, and two slots for the new cartridge software from Acornsoft.

If you own a BBC B, you could win a DFS disc interface from Acorn, allowing you to connect a wide range of disc drives to your computer. Acorn Computers will even arrange to have the interface fitted for you, bringing the value of the prize to about £90.

All you have to do is to find the secret message in the program listed here.

Unfortunately the gremlins have struck again and line 70 is missing. As luck would have it, the program will not work without the line. What we would like you to do is to write line 70 and tell us the encrypted message. You must answer three questions. They are:

What is the missing line 70?

What are the four possible positive numbers which will break the code?

What is the encrypted message?

Once you think you have the answers, send them on a postcard to:

Acorn Programs Competition, ECC Publications, 2 Newington Green Road, London N1 4AQ.

**G**ARDENERS should find **Vegetable Planner** by Steve Lucas of Cheddar Hulme, Cheshire a useful guide to vegetable growing. On the first screen, a chart shows you which plants should be grouped in a plot and rotated every year. You can then choose to look for any particular vegetable and find out when to plant it, where, and in what type of soil; or you can enter a month and discover which vegetables are to be sown or harvested at that time.

The program lists more than 30 types of vegetable and you can, of course, alter the data to suit your needs. **Vegetable Planner** will run on both the Electron and BBC B.

## FOR THE BBC MICRO SOFTWARE

### TINY PASCAL

Pascal-7 is a 16k Eprom program capable of compiling Source Pascal into a compact and very fast threaded-interpretive-code. Full editor and compiler support are included and the program is supplied together with comprehensive documentation. **PRICE£59.00 + V.A.T.**

### X.CAI

An eXpert Computer Aided Learning package in 16k Eprom and support disc. No programming skill required to construct learning 'sessions' as the program is 'screen' driven. Facilities include Text pages, Graphics and Histograms. **PRICE£65.00 + V.A.T.**

### FORTH

FIG-FORTH in 8k Eprom together with manual. **PRICE£34.72 + V.A.T.**

### LOGO-FORTH

A 16k Eprom program introducing this very powerful but extremely friendly Turtle-Graphics language. Users also have full access to the Fig-Forth support nucleus. Full documentation is included. **PRICE£59.00 + V.A.T.**

### M-UTS

Powerful machine code monitor with disc utilities. **PRICE£19.95 + V.A.T.**

(Special discounts available for educational establishments for all the above software)

## HARDWARE

Always in stock Printers, Disc Drives IC's etc.

## FOR THE EPSON HX20

### SOFTWARE

FORTH ROM including full documentation. **£34.72**

### HARDWARE

Expansion Unit, Paper, Microcassettes etc. Please phone for quotes

Retail/Mail Orders/Dealers

enquiries to:

**HCCS Associates**

## MAIL ORDER ADVERTISING British Code of Advertising Practice

Advertisers in this publication are required to conform to the British Code of Advertising Practice. In respect of mail order advertisements where money is paid in advance, the code requires advertisers to fulfil orders within 28 days, unless a longer delivery period is stated. Where goods are returned undamaged within seven days, the purchaser's money must be refunded. Please retain proof of postage/despatch, as this may be needed.

### Mail Order Protection Scheme

If you order goods from Mail Order advertisements in this magazine and pay by post in advance of delivery, Sinclair User will consider you for compensation if the Advertiser should become insolvent or bankrupt, provided:

- (1) You have not received the goods or had your money returned; and
- (2) You write to the Publisher of Sinclair User summarizing the situation not earlier than 28 days from the day you sent your order and not later than two months from that day.

Please do not wait until the last moment to inform us. When you do write, we will tell you how to make your claim and what evidence of payment is required.

We guarantee to meet claims from readers in accordance with the above procedure as soon as possible after the Advertiser has been declared bankrupt or insolvent (up to a limit of £4,250 per annum for any one Advertiser so affected and up to £10,000 per annum in respect of all insolvent Advertisers. Claims may be paid for higher amounts, or when the above procedure has not been complied with at the discretion of Sinclair User, but we do not guarantee to do so in view of the need to set some limit to this commitment and to learn quickly of readers' difficulties).

This guarantee covers only advance payment sent in direct response to an advertisement in this magazine (not, for example, payment made in response to catalogues etc., received as a result of answering such advertisements). Classified advertisements are excluded.

## Micro desks designed for your home

**NOW - the DX80  
Junior for just  
£19.95 (plus £6.50  
delivery)**

The DX80 Junior Home Computer Desk is more than just a practical display unit for your micro system. It's a stylish piece of furniture that comes in a range of colours and finishes to ensure that it fits your lifestyle. Available in Cream, Signal Red, Black, Oak style, and Arctic White, the DX80 Junior is delivered to your door in kit form with easy to assemble instructions. Approx sizes: Depth 19", width 22", height 36". Price does not include computer equipment and accessories. Dealer enquiries invited. Tel. 0993 58514.

Post to: DX Marketing (EAL), Unit PP, Millman Road, Hemford, Hertfordshire SG14 1NH. Please send me..... DX80 Junior Home Computer Desk at £19.95 each (add £6.50 for delivery, (VAT included))

**U**NABLE to find employment elsewhere, you have decided to join the army, where you have the good fortune to join an elite parachute regiment. Having finished your training, the moment has arrived for you to jump from an aircraft.

Can you touch down on the red landing pad below? Each time you do so, you score 10 points, but if you miss you will be killed. Fortunately, you have three lives and there is a 100-point bonus for clearing the first level. You will also gain an extra life if you reach 10,000 points.

Manoeuvre your parachute with Z and X to move left and right and press the space bar to jump from the aircraft.

**Sky Diver** was written for the BBC B by Stephen Murray of Leek Wootton, Warwickshire.

# One-Armed Bandit

**Y**OU HAVE to earn the money to play the fruit machine in this educational gambling game written by Roland Waddilove of Widnes, Cheshire.

Feed 10 pence into the slot machine and see if it produces three fruit of the same kind. If it does, you win a 50 pence jackpot but if you lose and run out of money, you must answer a few

simple mathematics questions to obtain some more. You can choose how many questions you want to answer, in several categories — adding, subtracting, division and multiplication. If your times tables are a little rusty, you can even consult whatever table you like.

**One-armed Bandit** was written for the Electron and will also run on the BBC B.

**M**R DOO has just built a brick wall but someone is throwing the bricks back at him. Help him to catch the bricks before the wall falls down, using the Z and X keys to move our hero left and right.

Mr Doo was written for the BBC B by Simon Hackett of Nottingham.

# MUNCHMAN

**E**LECTRON owners familiar with the classic arcade game of Pac-man will enjoy this version by Shaun Jones of Widnes, Cheshire. The player steers the red muncher round the maze using A to move up, Z to move down, and N and M to move left and right.

Each of the dots in the maze is worth 10 points and picking up the fruit in the corners is worth 50 points a time. Beware of the monsters which are trying to make a meal of the munchman.

Use A and Z to move up and down, N and M to move left and right. **Munchman** will also run on the BBC B.

# Formula One

**F**OOLISHLY, you are driving your Formula One car the wrong way round the race track. Can you avoid the oncoming cars? Use Q and P to steer your car left and right, gaining 100 points for each car you pass. You have an automatic accelerator and your speed will increase gradually as you reach 500, 1,000 and 10,000

points. The track becomes narrower the further you proceed. If you survive all the dangers in level one, you go to stage two, where each car is worth 250 points. At the winning post you will be welcomed by a chequered flag.

Formula One was written for the BBC B by Stephen Galea of Hornchurch, Essex.

# ERRORS

**I**N THE August/September issue, the first section of the **Ghost Hunter** listing, containing the program graphics instructions, was inadvertently omitted.

We apologise for the inconvenience which many may have experienced as a result. We are investigating the cause of the difficulty and will provide the solution when it is resolved.

Two other errors in our last issue have come to our attention, both concerning lines missing in listings.

**Gothic Horror**, line 690 should read as follows:

```
690IF$ = "/" ANDX% > 2Y% = Y%  
-1:PRIN
```

**Whist** (page 55), the missing line is:  
1150IF win = 1 THEN PROCy  
play:PR

# MISHAPS

## Programs must be your own work

FOLLOWING recent problems involving readers sending programs which were not their own work, we aim to ensure that does not happen again by deciding that only programs which are accompanied by a Program Voucher will be considered for publication.

All you have to do is complete the form below, which will

be repeated in each issue, and send it with your program, which should be sent on cassette or disc to the address which appears at the front of the magazine.

With your co-operation we can make sure that *Acorn Programs* continues to be the best source for interesting and original games on the BBC B and Electron.

Please complete this form and enclose it with any program which you send to us for possible publication.

To: Acorn Programs, 2 Newington Green Road, London N1 4AQ.

I enclose .....program(s) for the .....computer.

I guarantee that each program submitted is my original work.

Signed .....

Name.....

Address.....

# £24.<sup>95</sup>

## PRICE BREAKTHROUGH

# BBC SPEECH

## Speech Synthesizer for the BBC Computer

- Totally unlimited vocabulary is now possible with the revolutionary "SWEET TALKER" Speech Synthesizer for the B.B.C. A or B Microcomputer, any series.

- The CHEETAH "SWEET TALKER" simply plugs into speech socket IC99 within the computer. No soldering, no cutting of tracks, no headaches.

- Based on an allophone system you can easily program any word, sentence or phrase and incorporate speech into your software games.

- Fully tested and guaranteed. Complete with demonstration cassette and full instructions.

Cheetah, products available from branches of

  **W.H. SMITH** and **Rumbelows**

Price includes V.A.T.

# Mathematical certainties

Jeremy Richards' programming series goes on from numeric variables to loops

**I**N THE FIRST instalment of this series I left you with the problem of writing a program to test a person's knowledge of any multiplication table. Given the commands I covered the last time, you should have been able to write such a program. There is no single correct way of writing it but you should have been able to construct a program which works in a similar manner to the one I offer here:

## Program 1.

```
10 counter = 1
20 INPUT "Enter multiplication table", table
30 INPUT "What is"; counter; "times"; table
40 INPUT reply
50 IF reply = counter * table GOTO 80
60 PRINT "That is wrong ... Try again"
70 GOTO 30
80 PRINT "That is correct ... Let's try another"
90 counter = counter + 1
100 IF counter > 12 GOTO 120
110 GOTO 30
120 PRINT "You have completed the"; table; "times table."
130 END
```

The program is by no means perfect and I will show you how it can be improved but first see if you can understand the way it works. There are three numeric variables at the heart of the program. The numeric variable counter is used to keep track of the number to be

see whether the answer is correct. It does so by seeing whether the number held in variable reply is equal to the sum of counter \* table — remember that \* is the sign for multiplication. If it is correct, the program goes to line 80 — GOTO 80.

If the user has typed an incorrect answer an appropriate message is printed and the question is printed again by sending the user back to line 30. By increasing the value of counter when the answer is correct, the same line for asking the questions can be used but with a different number.

You might think that is all we can do with this particular program but that is not so. Would it not be pleasant for an element of uncertainty to enter the program? At the moment the program is extremely predictable, as it will ask the questions in order from one to 12 but we can enter the element of uncertainty by letting it choose a random number every time a new question is asked.

To do that we use another BASIC keyword, RND. It is a random number generator facility and builds into a program randomness. For instance, instead of writing:

```
counter = counter + 1
```

we could write:

```
counter = RND (12)
```

This would cause a random whole

number to be added to counter. RND is always fun and program two is a short game to test your powers of observation and memory. A set of numbers will appear briefly on the screen and you have to recall the numbers.

## Program 2.

```
10 goes = 0
20 counter = 0
30 CLS
40 x = RND (99999)
50 PRINT x
60 wait = INKEY (50)
70 CLS
80 INPUT "What was the number", qnum
90 IF qnum = x THEN PRINT "Well done"
ELSE PRINT "Wrong"
100 IF qnum = x THEN counter = counter + 1
110 goes = goes + 1: IF goes > 10 GOTO 140
120 REPEAT:PRINT "Press the spacebar to continue": UNTIL GET = 32
130 GOTO 30
140 PRINT "You have scored"; counter; "out of 10"
```

Do not worry if you did not follow all the program, as I have put in a few new commands. They are INKEY, REPEAT — UNTIL, ELSE, GET and CLS. Line 40 is where the program chooses the random number and line 50 prints that number to the screen. To make sure that the number does not remain on the screen I have used the CLS command at line 70.

CLS is the command to clear the screen and in this program ensures that the number does not remain printed on the screen.

You are probably wondering how we can instruct the machine to keep the number printed on-screen for a specified period. If you were to omit line 60 you would not see the number, so therefore line 60 contains the necessary instruction to cause a time delay between the number being printed and the screen being cleared.

The command is INKEY and in the context of this program causes the program to pause for a certain time. That period can be altered by changing the number in the brackets.

Line 120 uses the commands REPEAT, UNTIL and GET. The function GET tells the computer we are waiting for a certain key to be pressed,

## 'Would it not be pleasant for an element of uncertainty to enter the program?'

multiplied and it is incremented by one every time the program reaches line 90.

The program allows the user to type in any number, which is the multiplication table to be tested. That number is held in the variable table. Note that I use meaningful variable names. You could, of course, call your variables what you like but it helps to clarify the program and makes it easier to follow.

Line 40 waits for the user to answer and the number entered is held in the variable reply. Line 50 then checks to

number between one and 12 inclusive to be assigned to the variable counter. By changing the number in the brackets, the range for a random number to be chosen is altered. Therefore:

```
anynumber = RND (145)
```

will choose a number between 1 to 145.

By incorporating the RND function into programs we can allow the computer to choose a number randomly. Besides using it in our multiplication program there are other ways we can utilise the command. Games of skill and

in this case the spacebar. How do we know it is the spacebar? Well, 32 is the number assigned to the spacebar key — you can look it up in the ASCII table at the back of the user guide — and therefore tells the program to recognise only the spacebar being pressed.

The REPEAT-UNTIL command sends the program into a loop, i.e., the command to wait for the spacebar to be pressed is REPEAT UNTIL the spacebar is pressed — GET = 32. The colons in line 120 divide the different statements and allow more than one command a line. That is what is called a multi-statement line.

The variable 'goes' counts the number of questions asked and the value of 'goes' is equal to 10 — line 110 — and the final score is given — line 140 — and the program finishes. In a similar way, counter keeps track of the score — line 100. To make the program more challenging you can change the possible number of digits presented by increasing the number in the RND statement — line 40 — or by decreasing the time delay in line 60.

Finally, line 90 shows a way of expanding the power of the decision statement IF. The command ELSE is very much as its name suggests. It tells the machine that IF an event has or has not occurred, THEN do this ELSE proceed to another course of action.

I mentioned the concept of loops and this is a very useful and powerful technique in programming. In my first article I showed how to ease the writing of your programs by using a counter in the program to increment numbers. For example, it's very tedious to type-in 45 PRINT statements just to print your name 45 times. To make it easier you could write the program as follows:

```
10 x=1
20 PRINT "Jeremy"
30 x=x+1
40 IF x<45 GOTO 20
50 END
```

There is a faster and more efficient way of writing this program. The an-

swer is to place the 'PRINT "Jeremy"' sequence within a loop and tell the machine that you want it repeated 45 times. This can be done using the FOR-NEXT command. Type-in program three:

```
Program 3.
10 FOR a=1 TO 45
20 PRINT "Jeremy"
30 NEXT a
```

As you can see, that is far simpler and quicker. When the program runs, variable 'a' is set to a value of one and then proceeds to line 20. When the name is printed, line 30 checks to see if there is a NEXT number which 'a' can be. As we have told the computer in line 10 that 'a' will equal all values between one TO 45, the program returns to line 10

remember is not to jump out of a FOR-NEXT loop if you can avoid it.

Now for procedures. They are one of the better features of BBC Basic and make programs very neat and easy to follow. Creating a large Basic program is no more than stringing together a load of small Basic programs. The best way of achieving this is to use a procedure and program five is an example.

```
Program 5.
10 PROCIntro
20 PROCQuestion
30 PROCReply
40 END
50 DEFPROCIntro
60 CLS
70 PRINT "The following is a short test of your"
80 PRINT "mental arithmetic. Press the SPACEBAR"
```

## 'One golden rule to remember is not to jump out of a FOR-NEXT loop if you can avoid it'

and 'a' is incremented by 1 to equal 2. That continues in a loop until 'a' equals 45. The numbers in line 10 can be whatever you like but remember they must go from low to high. IF you wish to count down you must use the STEP command. To see this working type the following three short programs:

```
Program 4a.
10 FOR X=1 TO 100
20 PRINT X
30 NEXT
```

```
Program 4b.
10 FOR X=100 TO 1 STEP -1
20 PRINT X
30 NEXT
```

```
Program 4c.
10 FOR X=1 TO 100 STEP 10
20 PRINT X
30 NEXT
```

Program 4a carries out what we have learned so far but to count backwards we have to tag on STEP at the end of the command — program 4b — to tell the machine we are counting backwards in steps of one. Try writing the program leaving out STEP to see the effect. Finally, one can use STEP to tell the computer to count in steps of more than one, for instance in program 4c I have told the computer to count in steps of 10.

You may have noticed also that in line 30 I just say NEXT without tagging the variable name on the end. It is not necessary to place the name on the end as BBC Basic understands that the NEXT statement refers to the FOR loop in line 10. One golden rule to try to

```
90 PRINT "when ready."
100 REPEAT UNTIL GET=32
110 ENDPROC
120 DEFPROCQuestion
130 x=RND (10): y=RND (10)
140 PRINT "What is x times y"
150 INPUT reply
160 ENDPROC
170 DEFPROCReply
180 IF reply=x*y PRINT "Correct" ELSE
190 PRINT "Wrong"
190 ENDPROC
```

Program five is another example of writing a mathematical program but this time it is split into three sections or procedures. Each section is a small program in itself and is given a name, i.e., PROCIntro, PROCQuestion, PROCReply. To call this subroutine we use the command PROC followed by the name of the procedure.

The program is then sent to the line where the subroutine is and carries out the commands in that section. To identify the beginning and the end of the subroutine, DEFPROC initialises the routine by DEFining the procedure name and ENDPROC tells the machine the procedure is finished. When the procedure has ended the program returns to the command after where the procedure was called, i.e., in program five after PROCIntro is carried out it returns to line 20 to PROCQuestion.

We can therefore say that the main program is just three lines long — lines 10 to 30 — and by splitting the program into subroutines and also giving the procedures meaningful names it is easier to follow. Try to use procedures in your larger programs and you will find that they help tremendously.

**H**ELP SIDNEY Squirrel gather as many acorns as he can before the long winter sets in.

The acorns are scattered about a large, frozen lake, and as Sidney skids over it, the ice melts so that he cannot cross his own trail. To make matters worse, there are leaves on the lake on which Sidney might slip and kill himself, and he only has three lives.

Sidney has enough energy for one jump, but there is no telling where he might land.

Be careful how you guide Sidney. If he approaches the acorns too quickly, he may lose his chance of picking them up. Beware, too, of sudden nightfall, when Sidney cannot see where he is going or how much time he has left.

In the enhanced version of the game, you will also have to cope with the park-keeper who is attempting to catch Sidney and make squirrel stew out of him.

The keys you need are Z to go left, X to go right, \* to go up, ? to go down, P to pause, R to re-start and space bar to jump.

# reaction timer

**R**EACTION TIMER, a simple program for the BBC B by A Moulder of Rainham, Essex will help you sharpen those reflexes so necessary for playing the latest computer games or for making the brilliant catch which might put the West Indies out of a Test match for good.

After a variable time, a question mark appears at a random position on the monitor display. Hit the RETURN key as fast as you can and, after three attempts, your average time will be given in centiseconds, together with your rating.

See the breakdown of what each section of the program does to help you understand how it works.

The program is run in mode 7. Use is made of the CHR\$ codes to produce coloured script.

Line 30 initialises a user-defined key for running the program.

Line 50 suppresses the cursor.

Line 110 produces a random delay.

Line 120 sets the internal timer to zero.

Lines 140-150 produce a random TAB display.

Line 190 is a cheat control.

Lines 280-340 print out reaction comments related to times.

Lines 350-360 simple sound generation.

**T**HIS SHORT program by M K Smith of Motttingham, London, enables your BBC B to play any tune you instruct it to play. All you need to do is to key-in the note, for example F#; if you need B flat, use A#, which is the same.

You can adjust the volume of each note by typing-in any number from 0 to 15; typing 0 will give you a rest in the tune. Keying one of the numbers at the top of the screen will determine the duration of each note. When asked for the octave, you type 'H' for an octave higher than B, otherwise press RETURN.

When you have entered all your notes, type 'S', press RETURN four times, and then sit back and enjoy the music.

**Line Tracer II \$17.99**  
Draw a line and the infra-red sensor picks it up and sends this 5 wheeled, twin motored robot along the course you plot.

**Piper Mouse \$19.99**  
Supersonic sound sensor activated. The condenser microphone picks up the sound to send the Piper Mouse scurrying where you want it to go.

**Monkey \$8.99**  
A command from you into the condenser microphone activates the gripper arms and sends the Monkey climbing along its rope.

**Circular \$29.99**  
Through its own hand-held remote control you issue instructions to the two independently driven wheels - sending the circular wherever you want it to go.

**Memocon Crawler \$34.99**  
This highly intelligent Movit is programmed through its own keyboard. Its impressive memory accepts a broad range of commands and gives you complete control.

# MASTER A MOVIT -THE MAKING IS O

**A**re you ready to take on the challenge? When you open up a MOVIT box, you move into the exciting new world of robots.

Everything from the printed circuit board to the motors are included, just waiting for you to make a start. And the detailed instructions take you through each stage of this new adventure.

To create this new generation of robot models all you need is a screwdriver and a knife.

What's more, MOVITS cost a lot less than you might think. In fact, the price is the only thing about them that's down-to-earth!

MOVITS all have their own characters and appeal. They're fun to put together, fun to run. Take your first step into the world of serious robotics. Send off for your MOVITS today.

# ONLY THE BEGINNING

**PRISM**

MOVITS - THE CHALLENGE CONTINUES

Please send me my MOVITIS straight away.  
I enclose my cheque for £\_\_\_\_\_ payable to Prism Consumer Products

```

FROM a mixed bag of queries, D Clayton of Lancashire, following my mention of the command OSCLI in the July issue, wrote to ask what OSCLI does and how to use it.

Last month I included a short menu program. One problem with it is that for every file loaded the appropriate command LOAD or CHAIN has to be used. It would be far simpler if one could type-in the name and the program would be loaded. It is not so easy as that. To see what I mean, try to set up a one-line program — just a REM statement is sufficient — and SAVE the program with the name "TEST", type-in Programs 1 and 2 and run them both.

**Program 1.**

```
10 name$ = "TEST"
```

```
20 LOAD name$
```

**Program 2.**

```
10 name$ = "TEST"
```

```
20 OSCLI "LOAD"+name$
```

Program one produces a syntax error message but program two loads the program successfully. What OSCLI does is to take a string expression and pass it to the operating system. It is rather similar to operating system commands and adds a powerful feature to Basic.

A natural extension of the foregoing program is to use it in a menu. The following program CATalogues the disc and then allows the user to type the name of the program to be used and implements OSCLI as the means of

# Peripherals which expand the frontiers of the BBC

## Modems and processors loom large among queries to Jeremy Richards

but there is still some confusion as to the differences between them.

The Z-80 second processor is aimed primarily at the business market and turns the BBC into a CP/M machine. The processor is a Z-80B running at 6MHz and has 64K RAM. By means of the tube interface the second processor allows the BBC to become an input/output processor whose job it is to handle the screen display and I/O jobs such as disc drive.

While that is happening the second processor processes programs. Effectively that splits the tasks of processing between two machines and speeds the

though if you are using Basic the increase is only to about 44K. The 6502, however, has already found a specific field in which it can be used, namely computer-aided design. The 6502 is practicable for simulation and graphics because of its speed.

The Bitstik package from Acorn is an implementation of the Robocom software originally for the Apple and is a professional package which provides an inexpensive CAD system. It may be the first of many products which will utilise the power of the second processor and it maintains the BBC as an exciting product.

All, though, is not good news. It seems that some people are having difficulty in getting a 6502 second processor to work with the paged ROMs. With sideways ROMs appearing in vast quantities, many people now have software on EPROM. Unfortunately not all these products will work with the second processor because of the way the EPROMs have been written, using locations which are incompatible with the tube software.

Two specific problems have arisen. First, where the ROM will not work when the second processor is working and, second, and more serious, where the ROM appears to prevent a second processor working. The latter is unusual and the answer is to disable the ROM before using the tube.

In the case of ROMs not working across the tube there is little you can do other than contact the manufacturers of the firmware and hope they produce tube-compatible ROMs.

My mention of modems and acoustic couplers last month has sparked requests for more information about the field. So here is a lightning introduction to the world of micro communications,

## 'The 6502 is geared to a wider market though it will probably have most appeal to enthusiasts who demand more speed and memory'

loading the file. As with last month's program, use !BOOT to call the menu program.

**Program 3.**

```
10 ON ERROR GO TO 30
```

```
20 *CAT
```

```
30 INPUT "Which file to load", file$
```

```
40 OSCLI "LOAD"+file$
```

Remember that OSCLI will work only if you have Basic 2 in your machine. If you have any more interesting uses of OSCLI, please send them in.

The next subject is second processors for the BBC. I have had several queries on the differences between the two processors, the Z-80 and the 6502, what they can and cannot do and their use. So I shall look at the two offerings from Acorn. The Z-80 and 6502 second processors were launched earlier in the year

time of execution. On the Z-80 the speed increase is approximately 30 percent on Basic programs, compared to 50 percent on the 6502.

The Z-80 is in a package with bundled CP/M software such as word processor, spreadsheet and databases. Aimed primarily at the business market, it provides business users with a relatively inexpensive CP/M system. Running under CP/M there is a full implementation of BBC Basic and utilities have been included to transfer from the DFS disc format to the CP/M format.

The 6502 is geared to a wider market though it will probably have most appeal initially to enthusiasts who demand more speed and memory in their programs. It doubles the memory to 64K,

with an explanation of the jargon which confuses many people.

Two terms you will hear used constantly are modem and acoustic coupler and they are often interchanged when meaning different items. Generally an acoustic coupler is where the handset of a telephone is placed so that the signals may be transmitted between two micro-

coms. The difficulty with acoustic couplers is that they can suffer from line noise distortion. A better method is to use a hard-wired modem where the modem is connected directly to a telephone line. That can also dispense with the need to pick up handsets and dial, as dialling can be handled from the micro — the new Prestel adaptor from Acorn is one such modem.

What happens when you connect a computer to a modem? The digital signals from a micro are converted by the modem into a form which can be transmitted along a telephone line to a receiving computer at the other end. The difficulty is that there is no universal system in use and there are many protocols — protocol being the accepted term for the rules used between machines.

When looking for a modem, make sure it will work with the systems you want. Firmware is available from various companies which can permit you to change the transmit and receive rates — i.e., speeds of data transmission — as well as other protocols.

Computer Concepts and Pace produce ROMs like Termi, Communicator and Commstar which permit the user to establish contact with a growing range of systems, many freely-accessible to the public, with public bulletin boards for users to exchange news and views.

To help survive in the world of communications I have listed below the most commonly used jargon.

Acoustic coupler: A modem which

Baud: Transmission rate of data.

CCITT: The international committee responsible for communications. Acronym for Comité Consultatif International Téléphonique et Télégraphique.

Full-duplex: A system which can send data both ways at the same time.

Half-duplex: A system which can send data both ways but only in one direction at a time.

There are also many protocols which systems may use, usually referred to by name like V21, V24. They refer to the bits-per-second rates, half- or full-duplex, and the kind of telephone systems being used.

So what is there to use? The best-known viewdata system is Prestel. Be-

## 'The communications industry is growing and learning fast and hacking is not so easy as it was'

transmits and receives data via the handset of a telephone. Also a portable package.

Auto-answer: A modem which can answer an incoming telephone call, rather like an answerphone for micros.

Auto-Dial: Enables the telephone number of the host computer to be dialled from a micro or modem. Not available with acoustic couplers.

sides providing news pages, business information and buying services, it allows users to send electronic mail and Telex messages and to download computer software, all down a telephone line.

There are other similar systems and for the enthusiast many a happy hour can be spent contacting people. Spending many a happy hour is where the problem arises, as telephone usage is not cheap. Fortunately many systems have free access either all the time or after 6pm and at weekends.

The one disturbing aspect of the communications market is the rise of the computer hacker. Most of us have probably heard or read of the War Games type of incident where young people have broken into military or banking computers. The communications industry, however, is growing and learning fast and hacking is not so easy as it was.

The BBC computer is ideal for telecommunications and there is support for the machine in that area and there are many Special Interest Groups for BBC users on the various systems. Where does that leave the Electron user? Well, certainly not in the cold. Because of the lack of mode 7, systems which use teletext graphics such as Prestel are not accessible but with the appearance of interfaces for the Electron, connections to modems will not be far away and I have just heard of a company launching a mode 7 interface for the Electron.

# A Free Training Course with Every Plotter or Disc Drive

Our Sweet-P, high resolution graphics plotters come with free computer based demonstration and instruction programmes which not only show you what the plotter can do, but teaches you how it does it. Our high quality floppy disc drives are supplied with a utilities disc that includes not only the usual file handling and operating software, but a teaching programme for each utility as well. HAL makes it easy for you to upgrade and teaches you how to get the best from your system.

# SIDNEY SQUIRREL

## Enhancement

These listings contain all the additions necessary to produce the enhanced version of Sidney Squirrel. We have included all of Part 1 for anyone who missed the original distribution.

If you already have a copy on tape or disc then all you have to do is LOAD PART1 into the computer and add lines 120 to 300 inclusive. This will overwrite some of the original VDU statements, provided you have retained the original line numbering. If not then it may be easier to start from scratch.

All the REM statements can be removed, as can the lines which only contain a line number, these were only used to separate the Procedures in the listing.

The same method should be used with Part 2. If you have the original listing SAVED then the lines can be simply added and they will overwrite some of the old lines. If you have RENUMBERed the program then delete the contents of the following PROCedure DEFinitions and add the lines in with suitable line numbers.

PROCsqurrl	1460 & 1470
PROCacorn	1520 to 1550
PROCchaser	1650 to 1710
PROCchpr	1760

The enhanced version should be SAVED as "PART2" so that line 70 in Part 1 can CHAIN it.

Part 1
