BRITAINS FASTEST GROWING MICRO MAGAZINE

No More Lucky Dip!

Have you ever eagerly loaded a new program only to discover that you've wasted your hard earned cash? We know how you feel - we've suffered too.

Our company, Mr. Micro Ltd, has grown out of a passion for home computing, an obsession that went far beyond a hobby.

We are determined to ensure that all programs and accessories which bear the Mr. Micro name are proven, tried, tested and debugged and represent excellent value for money. After all we were in from the beginning and we have built ourselves a hard earned reputation in the world of home computing.

Our packaging has undergone a complete re-design so that before you buy anything you know exactly what the package contains, how it works and what the screen display will look like.

No lucky dip—we've got nothing to hide. All our programs are well written, exciting and exhilarating, designed to stretch your capabilities to the full and extract every ounce of performance from your micro.

Mr. MICRO Ltd

69 Partington Lane, Swinton, Manchester M27 3AL, England. Telephone: 061-728 2282

STRETCH YOUR MIND & MICRO WITH MR. MICRO GAMES & ACCESSORIES

Mysterious Island Vic 20 16 K £9.90

Your graphic adventure begins after escaping from prison in a hot air balloon—try to land it on Mysterious Island, then the fun really begins. • Booby Trapped Fields • Killer Bees • Hostile Natives • Hidden Clues • Force Fields • Capture the Nautilus • Full Graphic Display • Several Games lead to Exciting Climax • Separate Practice Program • Includes Blank Data Tape to store the game to play later.

This game requires a high level of skill and lightning reflexes. All successful adventures can claim a unique personalised award by sending Mr. Micro their final position at the end of the game—(For use with Commodore Vic 20, 16k expansion, by joystick or keyboard).

Ramdam Vic 20 £13.90

This accessory enables programs which would normally only work with 3k expansion to work with 8k or 16k expansion. RAMDAM saves having to buy a 3k pack if you already own an 8k or 16k. With RAMDAM and a Commodore 16k expansion all known tape games will run on your Vic 20. • Includes Memory Test Program • Free 6-5k game - MICROVADERS for use with Joysticks.

Hunchy Spectrum 48k £6.90

Guide Quasimodo over the ramparts to rescue Esmeralda. Leap flames, dodge arrows and ring the bells. • Amazingly good graphics • Fast Arcade Action • You'll be surprised at what your micro is capable of • Very demanding.

Dragon Tamer Dragon 32 £9.90

Allows Atari type and other digital joysticks to be used with the Dragon—giving better response and more control. For the first time your Dragon will be able to reflect your true skills. • Achieve higher games scores • Less Frustration.

Plus To ensure maximum value, Dragon Tamer includes two original games for use with digital joysticks:

Goldrush Vic 20 3-5k £6.90

This graphic adventure program was the first in the world to offer real gold for the successful adventurer. An idea which has been much copied but never equalled. • Fun • Educational • Challenging • Clues • Puzzles • Searches • Fast Reaction Game.

Should you experience any difficulty in obtaining Mr. Micro products from your local dealer, they are available post free direct from Mr. Micro.

Send your remittance to: Mr. Micro Ltd, 69 Partington Lane, Swinton, Manchester M27 3AL.

Cheques should be made payable to Mr. Micro Ltd. Please allow 28 days for delivery.

Note to dealers

You should benefit greatly by stocking the Mr. Micro range of software and accessories. For further details telephone Jim Gregory at Mr. Micro without delay.

TRADE DISTRIBUTION BY:

P.C.S.

Unit 6, Scotshaw Brook Ind. Est.,
Branch Road, Lower Darwen, Lancs, BB3 0PR.
Tel: 0254 691211

Now in chip form.

If your BBC Micro could talk, what sort of accent would it have?

A BBC English one, of course.

Which is exactly why Acorn Computers, who designed and built the machine, have produced its very own speech chip featuring the dulcet tones of Kenneth Kendall.

Called Speech Synthesis, it's a pair of chips that can be plugged into your BBC Micro by your local BBC/Acorn dealer. On them, you'll find 164 words/syllables spoken in familiar fashion by the famous retired newscaster, all of which can be

combined to form several hundred other words.

The chips also provide the 'serial' processing capability whereby future software cartridges can also be plugged into the front of your BBC Micro. (The machine's vocabulary will be widened via such cartridges.)

Priced £55, Speech Synthesis is available from your local BBC/Acorn dealer. (To find out where that is, simply call 01-200 0200.)

If you'd like more information, he'll complete the story. In plain English, of course.

HARDWARE REVIEWS

Sharp Move 42

Sharp launches another attack on the home micro market this month with the £250, 64K MZ-700.

Rainbow 98

DEC has launched its challenge to the IBM PC in the shape of the Rainbow personal computer. But is it too late for DEC?

Electronic Mail 115

We take a transatlantic look at how Osborne's can communicate.

Spellmind 60

Enjoy the intellectual challenge of this Spectrum feature.

Soft Release 66

All the latest software for Spectrum, Oric, Vic 20, Atari 800, Dragon and BBC micros put through our reviewing tests.

Stop Press 74

A brief look at the software which arrived at the office just too late for a review this month.

Dragon Tales 76

Concluding our look at this year's batch of books on the Dragon.

CONTRIBUTORS

We are always on the lookout for interesting articles and reviews for publication in *Which Micro*? If you think you have something to say, why not put your ideas on paper?

Articles must be original and unpublished elsewhere. They should be typed or printed (dot matrix is fine), double spaced, and with wide margins. As a rough guide to length, there are about 800 words on a typical page of the magazine, so articles range between 800 and 2500 words.

Always keep a copy of anything you send in, and remember to include your address and phone number (if you have one) on any correspondence.

To answer the most commonly asked question — we do pay well for published material, payment normally following a fortnight after publication.

But before sending in, it's a good idea to glance through a few back issues, to see what sort of things get published, and so that you won't cover anything we've already dealt with.

AGF

PROGRAMMABLE JOYSTICK INTERFACE

for Spectrum or ZX81

ABOUT OUR PROGRAMMABLE INTERFACE

Surpassing the outstanding specification of our Interface Module II which still offers the best software support at its price, a Joystick Interface that is compatible with ALL SOFTWARE through its unique hardware programmable design.

The Interface plugs on to the rear connector of your ZX81 or ZX Spectrum.

Quick clip-on connections, which are configured from a reference card supplied, allow you to define which of the forty keys are simulated by which action of the Joystick. A pack of ten Quick Reference Programming Cards makes setting for your favourite games even easier. These can be filled in to show at a glance the configuration required and stored in the cassette case of the particular game. When you change to a game using different keys the module is re-programmed in a few seconds.

As with our Interface Module II the Programmable Interface accepts all standard switch Joysticks that are Atari-compatible. Two sockets are available which are connected together for two player games which use the same keys for both players.

The Interface resides in the keyboard address space and does not affect its operation or interfere with any other add-ons. A rear extension edge connector will accommodate expansion of your system.

The unique AGF key simulation principle makes it extremely easy to incorporate Joystick action in your own programs. All eight directions and fire are read by simple BASIC.

With every order comes a free demonstration program called 'Video Graffiti' plus a full set of instructions.

KEY FEATURES

- * Programmable design gives TOTAL software support.
- * Accepts Atari, Competition Pro, Wico, Starfighter, Quick Shot, Le Stick etc.
- * Rear extension connector for all other add-ons.
- * Free demo program and instructions.

PACKAGE CONTENTS SUPPLIED

- Programmable Interface Module as illustrated, complete with clip-on programming leads.
- Self adhesive programming chart detailing how to define which key is simulated by UP, DOWN, LEFT, RIGHT, and FIRE. This can be fixed on to the case of your computer or if preferred the protective backing can be left on. The chart is made of a very durable reverse printed plastic and is extremely easy to read.
- One pack of ten Quick Reference Programming Cards for at-a-glance setting to your games requirements. The card allows you to mark the configuration in an easy to read fashion with space to record the software title and company name.
- Video Graffiti demonstration program which is written totally in BASIC to illustrate how all eight directions and fire can be read. This is also a useful high resolution drawing program.
- 12 months guarantee and full written instructions.

JOYSTICKS

ATARI CONTROLLERS

FOR USE WITH OUR INTERFACE Module or VIC 20, Commodore 64, Atari VCS, Atari 400, Atari 800

GEM SOFTWARE

for LYNX, DRAGON,
SPECTRUM & ZX81 Software

CHARACTER GENERATOR by John Line £9.95
(DRAGON)

A program for the programmer, allowing creation and saving of character sets/shape tables and subsequent inclusion into users basic program. Demonstration program and full ASCII character set included.

CHATEAU by Pete Allan ... (DRAGON) £7.95

A new type adventure, in which you must wander the Count's old mansion in search of treasure! Of course, when the Count died and hid his treasure, he also left lots of unpleasant surprises for those brave enough to try and seek out his riches!! Come face to face with Ghouls and Ghosts, Vampires and Trolls; do you run or fight? Will the mysterious Travel Agent suddenly appear and whisk you away to far off places? Where can you find the key or the lamp? Is the clock booby-trapped? Will you die a cold and lonely death, or will you win through to claim the fantastic treasures of The Chateau??

MONSTER MINE by W.E. MacGowan (LYNX & DRAGON) £7.95

Escape from the mine with as much money as you can, but don't get closed in or caught by the prowling monsters. An addictive machine code game, with superb graphics and save facility.

Price (SPECTRUM & ZX81) £4.95

SULTAN'S MAZE by Christopher Hunt ... (LYNX & DRAGON) £7.95

Enter the 3D Maze in search of the Sultan's jewels, but beware, your strength may run out, or, you may come face to face with the Mad Guardian. A multi-difficulty game with fantastic graphics and sound.

All titles available mail order or Access.
All cassettes despatched by return of post.

Vizawrite 64

OUR PRICE
ONLY £52+VAT!

Designed especially for the CBM 64, VizaWrite 64 is a high-performance, low-cost word processor, with on-screen formatting, taking full advantage of the 64's colour, graphics and memory features... VizaWrite 64 supports virtually any printer (no interface required for parallel printers!) and can even read files from Wordpro, Wordcraft or Silicon Office... Supplied with a comprehensive and easy-to-follow user manual, VizaWrite offers the ultimate in personal computer word processing! VizaWrite is also available on CARTRIDGE (our price only £59+Vat!), and both versions support a tape cassette! VizaWrite can also be supplied in combination with VizaSpell (our price only £72+Vat!).

VizaSpell 64

OUR PRICE
ONLY £42+VAT!

VizaSpell 64 is the companion spelling checker to use with VizaWrite. With its 30,000 word disk-dictionary, VizaSpell works to the same high standard and ease of use as VizaWrite, offering ON-LINE spelling checking, WITHOUT the need for frequent disk-changes! VizaSpell takes on average just FOUR minutes to spell-check any document against its massive dictionary and new words can be added... AND you can search for word patterns!

VizaWrite and VizaSpell are just two products from our range of CBM software. Please phone or write for a free catalogue! ORDERING INFORMATION: ADD 15% VAT TO QUOTED PRICES & ORDER BY POST/TELEPHONE/PRESTEL, USING CHEQUE, ACCESS, BARCLAY CARD OR OFFICIAL ORDER. TELEPHONE 01-546-7256 FOR SAME-DAY DESPATCH. POSTAGE FREE EXCEPT ON CREDIT OR OVERSEAS ORDERS. (REF A17)

Software for
the BBC Micro

LOGO2

One of our most popular programs to date. This is not a game, but an introduction to the LOGO graphics language that has become so popular in schools. It incorporates the 'turtle' graphics and many other features common to all LOGOS. Fascinating patterns or other graphics work can be built up very easily using the set of inbuilt commands. The command set can be extended by adding new 'words' to its vocabulary that are based on the existing set. Logo 2 can be used as a very simple graphics aid for young children, but it can incorporate more advanced ideas — defined procedures, sub-routines, loops and even recursive programming. Supplied with full documentation.

£10.00 + £1.50 p&p + VAT

Now available
for the BBC micro

Beeb

DEE

The ROM based spreadsheet program

BEEB CALC

Following on from WORDWISE this ROM based spreadsheet program is extremely simple to use though still very powerful. For applications that require a 'spreadsheet' or a table of figures to be manipulated this ROM will be invaluable. It need not be limited to just the obvious business applications of financial planning but is also ideal for home budgeting, etc. Includes many special features such as the ability to transfer 'sheets' to WORDWISE for inclusion into reports. 40 or 80 column screen display. changeable column widths etc.

£34.00+ £1.00 p&p + VAT

WORDWISE

The renowned word processing package. Still clearly the market leader with sales now over 10,000, this has become "the standard" word processor for the BBC Micro — and it's still receiving very favourable reviews. Wordwise will work with tape, disc or Econet and includes automatic word counting and full control over text entered into the system. Supplied with a detailed spiral bound manual and an excellent free typing tutor program.

After 6 months on the market there is still no other product as simple to use and as powerful as Wordwise.

SOLO SOFTWARE

DRAGON CAVES

A 3-dimensional trip through a maze of over 1,000 chambers. Hidden deep in Dragon Caves is the Magic Amulet stolen from you by the Dragon's slaves. This Amulet must be found and removed from the Caves together with any other treasures that you may discover. In the maze there are several creatures, some of whom you must kill and others who will help you—if they feel like it. The only exit from the Caves is patrolled by a fearsome Dragon who you must defeat to escape with the Amulet. Superb 3-D graphics and realistic monsters make this a must for all owners of Sharp machines.

Price £9.95.

SOLO SOFTWARE

TOMBS OF KARNAK

A complex game of battles and discovery through a honey-comb labyrinth. First you are allotted a character which will determine your chances in the maze of 50 tombs. Next, you must confront the Guardian of the Tombs and the Quartermaster where you can barter for the armour and weapons that you will need. Then you start your journey through the Tombs of Karnak inhabited by an assortment of lethal beings who you must avoid or kill. Gory details of all battles are displayed on the screen—not for the squeemish amongst you. Characters from this game can be saved on cassette for use in further adventures.

GIVE YOUR VIC20 & 64 IEEE PLUS RS232

VIC and 64 users

Would you like to be able to access **any** of these peripherals from your computer?

- 1/3 megabyte disks (Commodore 4040 drive)
- 1 megabyte disks (Commodore 8050 drive)
- 10 megabyte disks (Commodore 9090 hard disk)
- Printers including a wide range of inexpensive IEEE and RS232 matrix and quality printers
- IEEE instruments such as volt meters, plotters etc.

Now you are no longer limited by the VIC or the 64's serial bus. Simply by attaching INTERPOD you can vastly increase the power of your VIC 20 and when used with the new 64, INTERPOD

turns the computer into a really powerful system.

With INTERPOD the VIC and 64 become capable of running really professional quality software such as Word-processing, Accounting, Instrument control and many more.

INTERPOD will work with any software. No extra commands are required and INTERPOD does not affect your computer in any way.

Using INTERPOD is as easy as this:

Simply plug INTERPOD into the serial port of your computer, power-up and you are ready to communicate with any number of parallel and serial IEEE devices and any RS232 printer.

WORDSTAR PLUS

THE WORDSTAR PROFESSIONAL

A complete word processing system in one package, the WordStar Professional comprises the latest edition of WordStar (3.3), MailMerge, SpellStar, and MicroPro's exciting new text cataloging program, StarIndex (1.0).

WordStar, considered the industry standard for word processing on microcomputers, is now available with all associated text processing programs in one complete package for the first time.

Housed in a smart two-binder set, the WordStar Professional is undoubtedly the most comprehensive text processing package on the market.

MicroPro's WordStar Professional is now available from Tradesoft dealers with £294 off the regular package price - this special offer is strictly limited until August 31st.

The WordStar Professional package includes:

- * **WORDSTAR (3.30)** - The latest edition of MicroPro's best selling word processing package, with a new user-friendly terminal and printer installation program which can be used to set the initial default options on functions such as justification and help level.
- * **STARINDEX** - The new addition to the text processing family, StarIndex enables the WordStar user to design and create an alphabetical index with sub-entries, a table of contents with up to 4 levels of emphasis, and other item lists.
- * **MAILMERGE** - A multi-purpose list merge program to provide personalised form letters, create invoices, print mailing labels, and produce 'boilerplate' documents from many different standard paragraphs.
- * **SPELLSTAR** - Companion proofreader program for WordStar. A comprehensive 20,000 word dictionary with full customisation facilities is provided and potential mistakes are highlighted in context.

This complete text processing package is usually priced at over £700. The WordStar Professional is available from Tradesoft dealers for the special offer price of only £414, giving an unbelievable saving of £294!

The opportunity to secure the WordStar Professional at this low, low price is available only until the end of August, so contact your Tradesoft dealer now for further details!

WORDSTAR FOR APPLE COMPUTERS

MicroPro's popular WordStar word processor, and the InfoStar database management package can now be used, simply and inexpensively, on the Apple II, Apple II Plus, or Apple IIe microcomputers, using the single board Apple StarCard.

As MicroPro products are CP/M based, extra costs are normally incurred in upgrading the Apple to support a CP/M based operating system.

The new StarCard packages include all that is needed to convert an Apple into a CP/M based system. The normal costs of the additional software and hardware used to do this is £223, giving a full price for each package of over £500. For a limited period only Tradesoft are able to offer, through their dealers, each complete package at a cost of only £295 - A saving of over £200!

Each package contains:

- * A MicroPro applications program, fully customised for the Apple computer.
- * An easy-to-read Installation Manual.
- * CP/M Operating System and Beginner's Manual.
- * An advanced design 6 MHz Z-80B Board with 64K RAM (built-in 70 Column and Expansion Interface Capability).

The packages support popular Apple peripherals, including 80 column board, floppy and hard disk drives, and printers.

Two packages are available fully customised for the Apple computer: the latest improved version of WORDSTAR (3.3), the most widely used word processing package on the market, and the new powerful INFOSTAR database system which has a range of uses including managing personal records and data records, stock control, time recording and invoicing.

At only £295 per package, this offer has got to be limited until the 31st August. So contact your Tradesoft dealer now!

****OVERSEAS ORDERS A SPECIALITY****

They're only after your money

You may have seen all those stories recently about Texas Instruments, the manufacturer of the 99/4A, taking a financial pasting. You may have thought that there was a company which, in a few months time at the outside, would be dead and gone from the home computer business. Not a bit of it.

The battle is now well and truly on between the manufacturers to buy the biggest slice of the home computer market. It is your money they are after, and there are signs that not all may be fair and scrupulous out there just at the moment.

Take, for example, Texas Instruments. It has taken a \$100 million-plus loss on making the 99/4A this year, and is rumoured to be actually selling the beast at a price lower than its manufacturing cost. Though this could hardly be called an unscrupulous tactic, it is possible to view it as not entirely fair. This is because TI, as a very big company, can afford to carry such a loss, and shows every sign of doing so for some time to come. It wants a goodly share of the business (after all it did, arguably, start it).

The High Street retailers also want to buy a market share — to be the one that the customers come to. That is one reason why

they all started to discount the retail prices of machines like the Vic 20 at the back-end of last year — a time when no dealers or retailers could get product to sell anyway, and when customer demand was astronomical. This, in other circumstances, is a recipe for prices to go up, not down.

The other manufacturers are joining in. Commodore and Sinclair have both bombed their prices. More recently, Oric has chopped £30 off its 48K machine and brought the 16K down to under £100.

For some of the smaller manufacturers the result of this is unfortunately eminently predictable. Many of them will be squeezed financially until their corporate pips eventually pop out and the companies will be no more. What is more, the pricing tactics of the main High Street multiples (which are broadly the same as the manufacturers) will mean that the smaller, specialist dealers will also be squeezed out.

This last factor will be especially sad, for in a market where the purchasers are predominantly sold products they do not understand by sales staff that do not understand the products, the potential demise of the specialist dealers that do understand the

products cannot be seen as anything but bad.

They will go, of course, because 'understanding' costs money, so the margins that they work on need to be higher than the High Street companies. Good specialist dealers will get 35% or more off the resale price from a manufacturer, while the High Street people will operate for less.

Indeed, if they want to buy market share they will operate on next to zero margins. But why?

The why is simple, they all know that the really big thing in micros is not hardware, but software. One computer can generate many, many program sales, just like hi-fi with records. Get your brand of computer accepted as the market leader and watch the software sales roll in. And those sales can be both long term and lucrative.

It is arguable however whether all this is to the long term benefit of the users, and more specifically, the potential users. There is a great deal to be said in favour of achieving some degree of standardisation in software formats, and the like. This would greatly expand the market potential for any author/publisher and keep prices down.

There is less to be said in favour of the price war on the hardware side, however. It is likely to terminate many manufacturers with extreme prejudice over the next year or so, thus reducing consumer choice and playing even more into the accountant-oriented, box-shifting attitude the industry has recently acquired.

Question: what is the difference between the object on the left, and the object on the right in our picture?

Answer: approximately 3,480 bytes. (Yes folks, these are the jokes).

The computer being held by Christine Houghton is a Sharp PC1500, with 3.5K bytes of RAM. The bowl being held by Dominic Powlesland holds approximately 20 bites of ram (or cow, or porridge).

The bowl is in fact one of the finds at the Heselton Parish Project in North Yorkshire, which is one of the most significant archeological excavations of recent history. Evidence has been unearthed of occupation from around 500 BC.

The Sharp machine is part of £4,000-worth of kit loaned to the project by the Japanese company. This is why the general manager of Sharp's Business Equipment Division, Paul Marfleet, stands behind finds researcher Christine, and project director Dominic.

Cutting prices and doubling 'thumpability' is all the rage these days, the latest company to participate being Lowe Computers which distributes the Colour Genie machine.

The price on this has been chopped from £192 to £168, while — at the same time — memory size has been doubled from 16K to 32K.

Lowe claims that this makes the Genie the lowest priced home computer with a full-sized typewriter-style keyboard. Some companies, perhaps not a million miles away from a naval ranking in Slough, might find that claim contentious, however.

More information can be obtained from (0629) 4995.

Grab-a-load-a-this

Mention the name Pifco and what doesn't come to mind? . . . Right, computers. But what about joysticks?

That famous purveyor of appliances guaranteed to make your hair curl in lots of interesting ways has entered the electronics field via its new wholly-owned subsidiary, Consumer Electronics, and its first products on offer are . . . joysticks!

The range is being imported from Suncom in the States and prices start at £9.95 for the 'Slik Stik', going up to £29.95 for the 'Joy Sensor' which is an electronic touch sensitive controller.

The joysticks will interface with the Atari CX2600, Atari Personal Computer, Commodore 64, Vic 20 and Texas Instruments 99/4A.

If you have an Apple IIe and around £40 to spare you can get a special souped-up version of the Starfighter joystick which has such refinements as a centering

adjustment and a throw selector.

Consumer Electronics tells us that this is just the beginning; it will soon be supplying other bolt-on equipment and its own software products.

Germans jump in

Once upon a time there was this German company that made a CP/M desk top microcomputer system which was quite nice. It wasn't anything too amazing, if you know what I mean, but it was nice (still is). Now this company is having a go at the home/personal market as well.

That company is Triumph Adler, best known for creating the typewriter upon which this is being written. The machine, due for launch in October, is intended to be a £350 'professional' machine. On the face of it this sounds like a contradiction in terms, but it could prove interesting.

For the money, the user will get a 64K machine with 32K of ROM, which contains a Basic interpreter. There will be both parallel and serial interfaces, a cassette recorder interface, and an optional disk drive. This will be important if users wish to make use of the machine's main claim to fame — a full CP/M implementation.

It would appear to be one of the cheapest CP/M machines so far available, and marks a growing trend being fostered by CP/M producer, Digital Research, to push the operating system down into this marketplace.

"Well, Michael, I know that Russell Grant thinks that the occlusion of Saturn in 'Mars with a bad aspect to the sun in Virgo means that the Royal Marines' head-banging formation team will demolish the Eiffel Tower in under three minutes, but the computer has a different view. The computer is predicting a BDOS error."

Yes, this is David Manuel, one half of the pair of pundits on London Weekend Television's game-to-end-all-games-and-give-us-all-a-rest. The Ultra Quiz. But these days, behind every pundit is a computer, and in David's case that machine is the Epson QX10. This is not totally surprising as David is Epson's training manager.

More Soft Hits

Stand by your beds, the publisher's on the rampage again. 'He-who-must-be-obeyed', the great Lord Alfred of Rolington, is about to marmalise an unsuspecting country with *Soft Hits*.

Those of you with sharp eyes and long memories will remember the name *Soft Hits*, a new software publishing operation. A few

months ago, it started life with *Phasorchase*, a game program for the Sinclair Spectrum. 'Life' in this context was a test marketing exercise in the north of England (what had they done to deserve that?—Ed).

Now *Soft Hits* is going national with *Which Micro?* publisher, the aforesaid Lord Alfred, geared to launch a game called *Painter* for both the Spectrum and the BBC A/B machines.

A novel way of covering both machines at the same time has been used. 'He-who-must-be-obeyed' has come across the cunningly obvious notion that, as cassette tapes come with two sides, they can hold programs in two different formats.

Painter will be followed by *Phasorchase* once it has been rewritten for the BBC machines. The games will be available at £2.25 on mail order and on news-stands where you see *Which Micro?*

64 widgets from Whitstable

Get rich?

Are you a bright young thing who sincerely wishes to be rich? Do you know lots and lots about computers — especially in business applications — and feel your time is worth at least £60 per hour to anyone of consequence?

Well, that is what the National Computing Centre is now charging at its Microsystems Centre for consultancy services to potential micro users.

This is an example of correct pricing strategy that the rest of the industry could follow

(even though the customers might not like it). The prices charged by the NCC are going up in response to demand, not down as in retailing and manufacturing business.

The demand is now so great it can't be serviced by the existing staff, and the Centre is looking for more people to take on this onerous but obviously lucrative task.

If you fancy your chances, the Centre is headquartered in New Fetter Lane, London.

Here's an interesting little goodie for the Commodore 64. It comes from a new company to the business, The Sixty-Four Supply Company, all the way from the wilds of Whitstable.

C64-Link is a cartridge port attachment that upgrades the Commodore Basic V2 to Basic V4. It also allows the user to then drive many of the existing Commodore peripherals, as well as hardware from other suppliers.

Fit the right leads to the cartridge and, according to the company, any combination of IEEE, serial or parallel devices can be linked. This includes other 64s, which sounds like fun. It costs

£100.

The Link is one of several products the new company is offering from a wide range of US-based manufacturers. Others include Script 64 which is, yes, you guessed it, a word processing package. It's available in either disk or tape format and costs £65. It is capable of handling up to 120 screen 'pages' or 999 disk pages. There is also Recipe Box which is a disk-based cookery book program that costs £15, and Pet Emulator, which turns a 64 into a machine capable of running Pet programs.

The Sixty Four Supplies Company can be reached at PO Box 19, Whitstable, Kent.

In-shore ants

I have mentioned the word 'insurance' before within these pages, and at the risk of being terminally boring, I'm going to say it again . . . "insurance". There, I've said it.

It is, unfortunately, one of the subjects that is of no interest to anyone until there is no longer any point in being interested in it. But with the average home computer costing well into three figures — representing a goodly slice of personal income as well as someone's pride and joy — insuring it against accidental damage or loss is a sensible move, especially if it costs nothing to do it.

'Nothing' is, of course, relative

here, for it depends on one important factor, an existing insurance policy. Home computers have now been included for coverage in the home insurance policy issued by the Cornhill Insurance Group, and have been included for free. Previously, the policy only covered TVs, audio and video equipment.

The company no longer discriminates against portable equipment either, so all those Osbornes, Epsoms and the like are as secure in their cover as their more sedentary relations.

Cornhill is on Guildford 68161 and at your friendly, neighbourhood insurance broker.

64 price de-elevation

Anyone who has recently bought a Commodore 64 at the full retail price of £345 is officially advised to kick themselves. In response to the fact that the High Street dealers have been generally discounting the

system to at least a considerable degree already, the company has responded by officially cutting the price.

The 64 now costs £199.13 exclusive of VAT — £229 with the tax. It can be expected, I suppose, that the dealers will now start discounting this price as well, but that will be their problem.

Slough's own naval people have also cut the prices of some of the peripheral bits that come with, and for, the machine. For example, £70 has been lopped off the price of the single disk drive, £10 off the 3K RAM cartridge, and £35 off the 16K cartridge. Games cartridges have been more than halved in price.

Japanese get set, maybe

The Japanese can normally be relied upon to produce electronic things faster, smaller, glossier and/or better than anyone else in the world. They do, after all, have something of a reputation for squeezing in more gizmos per pound than all the others.

What is strange therefore, at first sight, is the fact that both individually and corporately, the orientals have not swept all before

them in the micro business, just as they have elsewhere.

The major reasons why they haven't become the dominant hardware suppliers are two fold. The first, and less important, is that the Japanese manufacturers have been fairly busy servicing their own market. The second reason is the more important . . . it's software.

The Japanese, for a variety of reasons, have been somewhat

lacking in their appreciation of the importance of software availability, and slow in developing actual programs and operating systems. They have subsequently discovered that it doesn't matter if you make the best hardware in the world: without readily available software, only programming freaks will buy it.

So the recent announcement of a collaborative contract between 14 Japanese manufacturers of home computers and the American software house Microsoft (producer of the Basic upon which most home machines are based) is liable to correct this deficiency.

The deal covers the development of MSX, a specification for standard hardware and software features for 8-bit machines in the home use, games-oriented, low-cost market.

The 14 companies include NEC, Matsushita, Sony, Pioneer and Yamaha, and there is one US company, Spectravideo, also represented. The standard MSX specification includes Z80 processor, standard instruction set, standard Texas Instruments video display processor, and standard interfaces.

If it takes off as a standard, and there is every likelihood that it will, the MSX specification will give the manufacturers a considerable degree of 'clout' in the marketplace. This will come because there will be, for the first time, signs of a standardised format for software products that will run without modification on a number of machines. This will make a bigger volume market for each new game or educational program, which should make them (theoretically at least) cheaper and thus more attractive to the user.

The first product announcements to meet the MSX specification are anticipated to appear some time before the end of the year.

So, what happens if you want to expand your Spectrum, you know, really expand it, not just add some RAM.

One answer is to get a buffered expansion system like this one from U-Microcomputers. Having made a living out of making add-on boards for the Apple II, it has now turned its attention to the Spectrum, and produced an expansion system that allows a maximum of seven add-on boards to be plugged in.

It consists of two expansion boards, one a 4-slot buffered backplane, and the other a 3-slot extension backplane. It has also produced a prototyping/hobby board for those with a penchant for soldering irons, and two interface cards.

To start with, the expansion set will be available on mail order only and more information can be obtained by phoning (0925) 54117.

The man apparently drying his under-arm deodorant is Barry Young, managing director of Leisurebase.

This is a new franchise group that has set up around the country, and is an off-shoot of the Photomarkets camera shops franchise. Leisurebase is selling them-there home computers. Particularly, that means machines like the Atari, Commodore and Texas computers as well as the Sinclair stuff, like wot young Mr Young is holding in his left hand. The other thing is a Vivitar camera.

Despite franchising new dealer operations in 21 towns around the country, from Basildon to Weston-super-Mare, one question still remains. Why does he look so unhappy about it all?

An IBM PC in your pocket

What have Dr Adam Osborne, a technology agreement between semiconductor manufacturers Intel and Harris, a licensing deal between IBM and CP/M author Digital Research, and a dinky little briefcase all got in common?

In all fairness, the answer is nothing — at present. In the future, however, the connection could be quite strong.

The long-term reason for this will be the design, development and sale of an IBM PC-compatible, battery-powered portable computer running multi-tasking software that could eventually be really rather inexpensive — one hates to use the word cheap, doesn't one?

Now this is, of course, all speculation at present, but to start at the beginning. . . . A few weeks ago, Harris Semiconductor and Intel announced the formal culmination of a technology deal that existed between them. The objective was to produce a version of Intel's 8086 processor in the low-power semiconductor

technology, CMOS. This it has now done, and it plans to follow that with a version of the 8088, together with all the peripheral and memory chips needed.

Harris intimated that it was "talking" to several companies about using the 8088 version in an IBM PC-type box, though it wouldn't say exactly who. This would make a small, low power PC-compatible machine running from batteries a distinct possibility.

More recently, a deal has been announced between IBM and Digital Research, making Concurrent CP/M-86 officially available on the PC.

At present Concurrent CP/M is pretty heavy metal stuff, aimed primarily at the business user. There, the advantages of being able to multi-task — have the computer run a print program while doing something else, for example — are considered a 'good thing'. But Digital Research knows that the home user end is where much of the future lies, and is looking to that market, gearing its software

prices accordingly.

Dr Adam Osborne's part? Well, he recently suggested two factors for the future in micros. One is that IBM compatibility is going to be the thing, "no more and no less, otherwise you're in trouble," to quote the good doctor. He also said that within a couple of years he could see flat-screen displays offering 80-column by 24-line capabilities being available at a reasonable cost.

Put that lot together and what could you get (with reasonable emphasis on the 'could')? Yes, a fully portable, flat-screened IBM-PC compatible machine running multi-tasking software and able to operate from a few small batteries. Sounds like fun doesn't it, especially if the price could be squeezed down low.

As to who will do it, and when? Well, it could be a number of companies, not least of which could be the jolly blue giant, IBM, itself. If it comes, expect it to be announced within the next 18 to 24 months.

"What," you may well ask, "is she doing?"

Well, she's getting fit — and playing with her Atari CX2600 video game system, of course.

"But what's the connection?" says you, raising a weary voice to ask the obvious.

Good question. The idea works on the principle of a treadwheel sewing machine. Your exercise bike is linked up to the Atari and the faster you pedal, the faster you get blasted to smithereens on the screen.

Suitable for most road race or action games, the 'aerobics joystick' costs £34.95 and "takes away the boredom from biking, the guilt from idle gaming, and puts fun into fitness". We're going to take some convincing . . .

Dave Briskham and John Humphreys are seen here taking a break from looking for the Ring of Darkness in Epping Forest.

They won't find it there, however, because it is, of course, a games program, and none of the big retail chains have branches there yet. (Geddit?)

Ring of Darkness is the big one from Winterson and its two partners, Messrs Briskham and Humphreys. They now hope to emulate its success with a new game, called Operation Gremlin. Here, the player controls eight characters (Captain Bono and his crack squad to be exact) in an attempt to save an evacuated city that has been attacked by the dreaded Sennapods. Like Ring of Darkness, it has been written for the Dragon and the Oric machines.

Winterson can be found in Enfield, on 01-367 5720.

Romox comes to U.K.

The Romox programmer, about which I wrote last month, has rapidly found a UK agent, Prism MicroProducts.

This is the system that will allow dealers to produce copies of programs in cartridge form, for use in such machines as the Vic 20, Commodore 64, TI 99/4A and Atari.

Instead of using the standard read-only memories of the cartridge format, the Romox variants use programmable ROMs, which can be erased and re-programmed in a manner analogous to the cassette. At the same time as gaining this flexibility, the users gain the robustness of the cartridge format.

Trials of the Romox machine are due to start in the Autumn with dealers in the Birmingham area. A national launch is expected in 1984.

One feature that might be added to the machine before it finally hits the streets nationwide is the facility to actually run the programs available in demonstration mode. This way, customers will get to see the goods before they pay.

Prism is on 01-240 1042.

Micronet Spectrum modem

A key development in the potential success or failure of Micronet 800 has now occurred, with the launch of the VTX5000 viewdata modem from Prism. This, together with a Sinclair Spectrum, creates the lowest cost videotex terminal so far produced, and provides access into Micronet 800, and Prestel in general, for under £200.

The VTX5000 turns the Spectrum into an intelligent videotex terminal and communications system. It does this by providing both 1200/75 baud full duplex transmission rates for viewdata work, and 1200/1200 half-duplex communications for

user-to-user operation. It has been specifically designed to work with both the 16K and 48K versions of the Spectrum, and fits exactly underneath the beast.

The retail price of the modem is £99.95, but for those who take out a subscription to Micronet as well (or those Spectrum owners currently sitting on the waiting list) the price will be less.

Prism's new modem is a key development for Micronet because it broadens greatly the number of users that are potentially open to the service, which offers a tele-software service for users, as well as news, views and information.

MR CHIP SOFTWARE

VIC 20 GAMES AND UTILITIES

JACKPOT

This is it, the ultimate fruit machine program for the VIC, with nudges, hold and respin, 100% machine code. "Jackpot is a beautifully written simulation giving superb graphics, animation and use of colour. In fact, this program makes Commodore's fruit machine cartridge look unbelievably cheap and nasty". Home Computing Weekly, 19th July 1983 **£5.50**

Kwazy Kwacks Accuracy and speed are required for this shooting gallery, superb use of colour and graphics in this new and challenging game from the author of JACKPOT, 100% machine code joystick and keyboard control **£5.50**

BUGSY (Joystick Only)

This is a Minefield with a difference as you step on the stones whilst collecting purple boxes which give you both time and points, they disappear from beneath your feet. **DO NOT DESPAIR!** "BUGSY" will randomly replace the stones but avoid bumping into him or it's sudden death! An original compulsive and challenging game.

MINI-ROULETTE — PONTOON — HI-LOW

Three great games of chance for the VIC, try to beat the computer, hours of fun, full colour, sound effects and tunes **£5.50**

DATABASE — create your own files and records on tape **£7.50**

BANK MANAGER — Computerise your bank account **£5.00**

SUPER BANK MANAGER — A full feature version any memory size, but needs 3K expansion **£7.50**

M/C SOFT — Machine code Monitor and Disassembler, any memory size **£7.50**

COMMODORE 64 GAMES AND UTILITIES

LUNAR RESCUE — Our own version of that popular arcade game... **£5.50**

PONTOON — ROULETTE — ACE'S HIGH

More powerful versions, that make three great games of chance for the 64 **£5.50**

M/C SOFT 64 — Assembler and Disassembler, with decimal to hex converter, everything our program for the VIC will do and more **£7.50**

BANK MANAGER 64 — As our Super Bank Manager, but for the 64. Now available on disc with added facilities **£7.50**

Full documentation with all utility programs.

Other software available for the VIC and Commodore 64, send for free brochure, including **RABBIT SOFTWARE** at **£5.99**.

Send Cheques/PO's to:

**MR. CHIP
SOFTWARE**

ABOUT OUR FAIR DEAL POLICY AND TOP ROYALTIES.**

All programs now available on disc please allow £2.50 ea. extra.

DEALER ENQUIRIES WELCOME

Instead of watching TV tonight, you could be making your own program.

- * Program it to calculate the monthly repayments on a mortgage.
- * Program it to calculate your expenses.
- * Program it to perform lengthy calculations quickly.

PB100 R.R.P. £49.95

- * Program it to rank the sales of different products.
- * Program it to play games.
- * Program it for statistics and planning.

Most people are aware that computers of all types are playing an increasingly important role in business, education and in our daily lives. What you may not be aware of is how easy (and inexpensive) it is to use computer technology to your own advantage.

The Casio PB100 is the ideal personal mini computer for someone who's never used a computer before, or for someone who knows about them, but wants a slim, pocket-size computer for personal use.

It's easy to understand and use. Naturally it comes complete with a free instructional manual, but in addition we give you a comprehensive 'Learn-As-You-Go' book. Demonstrating the principles of BASIC language and programming, it takes you step by step through the possibilities, so that you can get the very best out of this amazingly versatile machine.

So whether you use it as a valuable business tool, an aid to studies or just an introduction to the world of computers, choose the Casio PB100. It gives you all the quality and reliability of Casio at an incredibly low price.

- * 'Basic' language programmable with 12 digit display.
- * Auto-scroll with up to 62 character inputs per line.
- * 544 program steps (expandable to 1568 with optional OR-1 RAM pack).
- * Programs/data preserved when power off.
- * **FREE**, comprehensive 'Learn-As-You-Go' book, guides you through even the most complex problems.
- * System can be upgraded with FP12 mini printer and FA3 cassette interface.

CASIO MAGIC!

SINCLAIR'S SECRET

The Microdrive has finally appeared — is it a revolutionary breakthrough for Spectrum owners?

In the end you almost get to be glad that it's over. After all the ballyhoo, and all the on-off announcements, the Microdrive for the Sinclair Spectrum has finally appeared. That said, it seems logical to suppose that the next question might be along the lines, "Is it worth buying?"

The short answer has to be yes, for it gives the large army of Spectrum owners an extremely useful form of mass storage that is, theoretically at least, considerably better than cassette. The long answer may well require some qualification, for the Microdrive is like nothing else on the market, and as such takes Sinclair users even further away from what seems to be becoming accepted as a standard approach for mass storage, the microdisk.

This, of course, has never worried Sinclair the man, or Sinclair the company, and it shows no signs of doing so now. The drive blows all sorts of holes in normally accepted pricing for secondary storage, even with its essential add-on interface, though the techniques used to do it are certainly different.

The drive itself is a small unit, some 8 x 9 x 5 cms in size. Into its small frontal orifice goes a tiny tape cartridge which is filled with a continuous loop tape capable of holding a guaranteed minimum of 85K bytes of formatted data. The drive has a retail price of £49.95.

That, unfortunately, is not the end of the story on price, for to make the drive run at all on the Spectrum, it is necessary to also purchase Interface One. This is the special interface unit that contains the operating system for the Microdrives.

It plugs into the expansion socket at the back of the Spectrum and is screwed to the underneath of the machine. This effectively jacks up the back of the computer, making the keyboard that little bit more accessible. It also means that those owners who have put their Spectrum into one of the enclosure systems that include such things as proper keyboards could be rather upset when it comes to using Microdrives, for the interface will not fit.

This interface, which costs £49.95 by itself but only £29.95 if bought with a Microdrive, can

directly drive up to eight cascaded drive units from one Spectrum. In addition, it brings to the machine an RS232 port — which adds the chance to set up communications with other machines — and a local area network. This is a high speed communication link that can accommodate up to 64 Spectrums. A full screen of data can be transmitted between machines in three seconds. In true LAN style, this network will allow one machine to be dedicated to such functions as print serving, and any Spectrum will be able to access the data on the Microdrive of another machine.

The built-in operating system can cope with up to 680K bytes of storage split between up to eight drives. Each cartridge will be able to store up to 50 files which can be individually identified, sorted automatically and displayed in alphabetical order. It is primarily an extension of the Sinclair Basic which includes file handling and communications capabilities. It is capable of loading a typical 48K program in 3.5 seconds.

There is, of course, one other cost that needs to be added to the £79.90 so far spent on getting one

Microdrive working, and that is on the cartridge itself. Each one, which is a small continuous loop tape in a neat plastic housing less than one inch square, costs £4.95. It looks remarkably delicate, but Sinclair claims it is quite robust.

One potential weak-point however, especially for any Spectrum user contemplating a reasonably arduous work schedule with the machine, is the relatively low guaranteed read/write cycle rate. Sinclair states that each cartridge is good for just 5000 read/write cycles. Now this may sound to be a reasonable number, and for simple applications like loading games programs it is. But for anyone planning to use the drives for tasks like word processing or some form of database management, it does not amount to much.

The cartridges will be available both direct to the end user and via third party software suppliers on an OEM basis. Some of these are being supplied with Microdrives so that programs can be prepared for sale in the new format. This could be a small bone of contention, for some leading software companies have not received drives for this purpose. There have been suggestions that only those software companies closely associated with Sinclair are currently being favoured.

The drive itself is powered directly from the Spectrum's power supply, and this can drive only one at a time. Cascaded systems are no problem, however, as the Spectrum switches on the drive in use only when required.

The big question for Spectrum owners, of course, is can Sinclair deliver the goods? It would not be the first time that the company has perhaps not been quite as diligent as it might have been with the launch of a new product, though in the past it could hide behind an understandable underestimation of sales potential. With the Microdrive, this excuse won't wash, and the company seems to know it.

The drive system is already being manufactured by Thorn EMI in numbers that are intended to be sufficient to meet the expected demand. Even so, there will be some early rationing, especially while the backlog of orders on the waiting list are serviced first. Much, according to the company, will depend on how many drives individual customers order. If they all order one, there should be no delay problems at all — if they all order eight then it will be long waiting list time again.

As there is an Interface One, it presupposes that there will be an Interface Two, and there will be. This will be for both ROM program cartridges and joysticks, and is scheduled to appear in the early part of next year. ■

If the number of computer systems on the market leaves you totally bewildered, we don't blame you.

And that's not your only problem. If you are not very careful, the system you buy today could well be obsolete tomorrow. That's how fast computer technology is progressing.

But take heart. There is one computer system that won't become obsolete. Because it is modular in concept it can be expanded both inside and outside to accommodate extra capacity and new advances—as well as being able to increase in size and capability to keep pace with your own growth or changing requirements.

You have a choice from a virtually unlimited range of CP/M compatible application software. Plus the support of total dealer back-up.

And, most important, you won't find that you've bought a system that suddenly doesn't meet your needs. The Communicator offers the facility to enhance and upgrade existing models to take account of new applications.

Comart have also met the stringent CCTA requirements. Which means we are A1. In short, Comart Communicator systems can keep pace with both progress and innovation.

So don't get bogged down with obsolete equipment. Contact your Comart dealer for a demonstration now.

The Comart Communicator. One computer system that won't sink into obsolescence.

What's more, it's British.

At any one of the addresses listed below you can see the remarkable flexibility of a Comart Communicator system for yourself.

In under three years, it has become a complete family of compatible, fully expandable microcomputer systems, covering

20 models and including single user, multi-user and multi-processing systems.

To become technical for a moment, there's a choice of 8 or 16 bit processors, up to 1 megabyte of RAM and a wide range of floppy and hard disk storage capacities and add on modules.

COMART COMMUNICATOR SPECIFICATIONS

	CP100 Series Systems	CP1000 Series Systems
Microprocessors:	8 Bit Z80A (1 to 6)	16 Bit 8086
Memory:	64K-512K bytes	256K-1M byte
Storage:	390K or 790K byte diskettes 5M or 20M byte hard disks	390K or 790K byte diskettes 5M or 20M byte hard disks
Operating Systems:	CP/M, MP/M11 & CP/NET, multi-processor 1 to 5 users	CP/M86, MP/M86, MS-DOS, 1 to 8 users

Features common to both CP100 & CP1000 Series Systems
Keyboard/Display: 105 Key, detached 14" green screen, swivel tilt.
Expansion: Internal—S100 cards, mainframe communications & protocols.
Expansion: External—stackable modules inc. cartridge tape & 8" floppy & hard disks.

PROBLEMS

Letters to: Hedley Voysey, Which Micro & Software Review
Scriptor Court, 155 Farringdon Road, London EC1R 3AD

Write on

Can the Spectrum be used for proper word processing? What bothers me is driving a printer to use a normal line length.

Colin Carter, Andover

The 48K Spectrum might fit the bill if an interface for a plain paper printer is added. The extensive use of word processing would probably justify the purchase of a proper keyboard and at that total price the Spectrum stops looking quite so cheap. However, I am guessing that you want to use the Spectrum anyway for its fun potential, and you may have bought one already.

Tasman Software of Leeds has software which I have not used, but the claim is that it puts 64 characters on the screen and with appropriate interfaces these appear on paper. This seems to be a development of a package which appeared earlier and seemed to be useful with the ZX printer.

Lisp

I am not sure I should admit to this — but having bought a BBC micro and not wanting to spend all my time ploughing through programming in Basic, I have wondered about buying Lisp. Lisp seems to be cheap as a new language to try. Would you think this worth experimenting with?

John Plowden, Bishops Stortford

I guess that what you are pondering over is the fact that Lisp has connections with students of artificial intelligence and the like. The biggest snag I can think of about Lisp (which is an old established programming language with some good text books to ease the transition to using it) rests with the fact that the UK set of people who use it is rather small.

It is always rather intimidating to find that you are doing something as a hobby and have few people to swap notes with. Most of those who use Lisp are those who have access to one of the university machines. It has been used to develop other ways of programming via Logo and Prolog.

Logo costs a bit to start using and all these languages tend to eat up memory capacity which in turn costs more money. My hope is that Logo will not go on for ever being thought of as just a tool for

introducing people, especially children, to computing, but will also be used to develop more interest in Lisp-like programs of many kinds.

The user group of the BBC micro world would form a basis for finding out if there are others working themselves into the Lisp scene. It would be pleasant to hope for more memory to be available on the BBC machine soon.

Natural speech

I have visited several computer clubs where there have been demonstrations of voice synthesis. These have all been very mechanical in style. I am told that this need not be so. I have a professional reason for making the enquiry and would dearly like to know if natural voice sounds can be obtained at a reasonable cost.

A. Marks, Newark

There are several suppliers of good voice production boards in the UK. The technology is driven by more powerful chips which use better techniques for sampling to avoid the mechanical sound you so dislike. You have probably heard demonstrations of software driven voice systems for producing speech patterns. These mostly use crude methods to save space and they can rarely match anything but the most basic style of speech. Without knowing more about your finances or technical abilities I am unable to do more than encourage you to persist.

BBC upgrade

Is there a snag with the Torch disk pack 'CP/N' operating system addition to the BBC micro — as the words used are not clear as to absolute compatibility with CP/M?

Mike Heather, Basildon

There should be no really fearful snags. The special difference with the Torch version is that the operating system is based in read-only-memory so that it is immediately available without having to load from disk. However, if you wish to use commercial programs you still have to be able to read the disks they are written on and you should check that the format is suitable for reading on the Torch units. This should be no problem for most suppliers of

programs.

The other main gain with the Torch upgrade to the BBC is the provision of decent amounts of user memory that comes with it. The Acorn people have been slow to put into dealers the promised twin processors with 64K store in each. The idea here was that for the faster 6502 the available user memory would rise to about 46K while the Z80 would have 64K also.

At the moment the Torch upgrade supplies the CP/M-based user with more memory than the BBC Basic user whose free space can be whittled down to as little as 4K or so, which is absurd in 1983.

Commodore pics

The attraction of the Commodore 64 for me lies with its graphics. If I am to use its full capabilities I want to know how much user store is still available to me.

H.D. Bailey, Deptford

Probably about 30K if you are using Basic and other normal programming areas. Even this space can shrink as you proceed to develop a connection with your program that produces values to drive the graphics. However, for a cheapish experiment in home computing, complete with graphics fun, it does look as if the 64 is a reasonable bet.

Low-cost printing

A dealer has told me that printers for attaching to the Commodore 64 involve a lot of expense, apart from the standard printer which I do not like. Is this true and are the disks for the Commodore up to scratch?

Sara Down, Dorking

I think the problem referred to is the lack of a Centronics parallel interface with the 64. The printer connection would use the IEEE 488 interface and to get away from the rather poor printer used by Commodore the extra cost might be worth it.

However, the dealers in the 64 seem to be quoting rather wide price variations for printers when fully connected to the 64 so it pays to shop around on the telephone rather thoroughly.

The disk options are more limited. The Commodore units supplied as standard with the 64 are

not well liked and are rather limited in capacity. I do not think there is much wrong with their engineering. However, the escape route provided by many dealers is to enable drives for the original Pet range to be hooked up, but there is of course another special box to buy to enable you to do this.

However, it dramatically enlarges the file capacity of the 64 so if serious business use is what you are after then this is a good route to take.

Sending messages

Will it be possible to use one of the new portable computers — such as the Epson HX20 — for composing text and then to hook up to an electronic mail service to send this to people? How much extra will this involve apart from buying a portable machine?

D. Cherry, London SW7

Yes, this way of doing things must alter the whole convenience factor in switching over to electronic mail. However, the adaptors for using Prestel for the message passing service differ from some other couplings to network services.

The costs based on the HX20 will be something over £800 using an ordinary acoustic coupler, fairly standard terminal software and text composing software. This cost will go higher if the unit is used in an expanded form and you will need a printer for keeping a hard copy of the messages sent back to you.

So, the capital investment is not trivial which is why the Micronet experiment in message handling via Prestel is welcome since the adaptors should be a bit cheaper. However, in either case it should be quite possible to keep the costs of using services such as these right down.

Using the portable machine to compose the messages and set up the handling steps will reduce the 'connection' time to the switching service to a brief period.

Letters TO THE EDITOR

THE EDITOR, WHICH MICRO & SOFTWARE REVIEW

SCRIPTOR COURT, 155 FARRINGDON ROAD, LONDON EC1R 3AD.

Advertising Rap

May I contribute to the light tone but serious intent of your June article 'Advertising Rap'?

Your columnist accurately diagnosed the major purpose of our Microframe commercial — that today's Microframe will still be in use in ten years time because of its 'future-proof' capacity to add new peripherals and processors as they become relevant over the next decade, without needing to alter the existing system's components.

I expect that *Which Micro's* "vast and approximately intelligent editorial crew" will, to judge by the responses of our intelligent customers, have worked out by now that the flying sink is a visual metaphor of the same point, i.e. that Microframe is a micro that will handle everything, including the kitchen sink.

Finally, may we at Tycom not only match your generous £10 prize for the most original suggestion to explain the sink's significance, but also present that same sink to the witty winner? *Peter Williams, Tycom*

This has got to be a prize beyond rubies or diamonds for the cognoscenti that constitute the readers of Which Micro? Just think of what your friends will say when you

tell them that it was you that won £20 and the kitchen sink that flew through the air upside down.

Don't forget, what we want is the real reason that sink flew across the screen upside down. Peter Williams has told you the actual reason it was there — (honest) — but don't let that stop you. Remember the old publishing maxim: never let the facts get in the way of a good story.

The winner will receive these stunning prizes at a champagne-style reception in the Luton Station refreshment bar.

So get your pens to paper and your WordStars to create-new-file: let us know why that sink flew across the screen upside down in the Tycom ad.

Vic 20 lives?

I am the happy owner of a Commodore 64 plus various peripherals, disk printer etc. I also have access to and on occasions (unhappily) use a BBC computer.

Having just read your July edition of *Which Micro?* I came to the conclusion that its name is soon to change to "Another BBC User Mag". All bow down to Cambridge.

My reasons for this are as follows: In *Commodore Call* you say and I quote, "you'll get a reasonably balanced view of Commodore". You missed the bit which should have said through the hands and eyes of people who don't like and have probably never used a Commodore, and we don't like them anyway, please buy a BBC.

You also said, "Now personally, I can't imagine why anyone would want to purchase a Vic 20". You go on to say, "With new computers springing up every month many offering substantially better features at a much reduced price".

What computer on the market today has as much to offer as the Vic 20 for the price: proper keyboard, not the rubber thing like the Spectrum or Aquarius or

the calculator thing on the Oric; a real screen editor, so you don't have to copy the whole line again like on the Dragon or the much overrated and over-priced BBC; a cassette recorder system that works and is easy to expand with disk printers etc.

Well, I can't name one. What other things do you want? More memory and 40 columns — OK, you win on those two, but 16K is only £27.50 and screen expanders start at £9.95.

I mentioned the tape system earlier. I saw in my local computer shop the best reason why the BBC is overrated. A BBC owner had taken his BBC and his cassette to the shop so he knew that the programs he purchased would load.

It was a good thing he did, too. He tried 20 different programs — he gave up on 17 of them because all the copies in the shop failed to load. Of the three only one loaded first time. That's not very good now is it?

On the other hand, with the Vic 20 I find it is very rare that a program will not load first time and I have never been through an entire stock of programs to find that none of them work. Why is it then that you and all other mags refuse to state these facts in your biased reviews?

You also give the impression that you have never used a Commodore computer by the things that you say, for example, "a clumsy series of poke commands". To use the sound on a Commodore 64 there are only seven pokes, to use the ENVELOPE commands on a BBC there are 14 and the order has to be correct. That's what I call painful.

The comment about the BBC being good value for money — it's the most expensive around. By the time this is read the Commodore 64 will be about £229.95 — nearly £200 less than the BBC, or half price.

One last question — would the BBC sell if it was called the ITV computer? No!!!

I would like to end this very biased letter by saying that I am not, and never have been, paid by Commodore or asked to do anything for them. I don't even like Commodore themselves — only their computers.

R.W. Barton, Aldershot

We do think that it's our job to help people decide what computers they should or shouldn't buy. If we can't think of any reason for readers to buy the Vic 20, we certainly won't invent them just to please those who use Commodore computers.

The fact is this; the Vic 20 is now an obsolete micro,

offering very limited performance for a relatively high price. Commodore has now decided to stop production which obviously implies that its view is similar. Recent price cuts on the 64 would also indicate that this is now Commodore's main product for this market.

To describe Pete Gerrard, the author of our *Commodore Call*, and until recently the editor of the magazine *Commodore Computing*, as someone who has "probably never used a Commodore" is daring to say the least.

The Vic 20 cassette system is one of the less useful on the market. It gives almost no information as to how the load is progressing, and is painfully slow. That of the BBC Micro is almost as sophisticated as a slow disk system, and although it did have its initial teething troubles, these were nowhere near as severe as the initial reliability problems experienced on Pets and Vics — the four Vic 20s we have used this year have all broken down at least once, with cassette and display problems heading the list.

Commodore's philosophy on improving its Basic interpreters and operating systems is well known — it doesn't do it very often. The slow, unfriendly Basics of the Vic and 64 are the result.

As for value for money, the Commodore 64 price cut to £230 does now make both BBC models look overpriced, partly as they contain many expensive facilities most home users will never want or need. However, the Electron, much closer on specification, should be launched by the end of August at a lower price (see *Here at last, page 34*).

Show time

We would like to draw your attention to the forthcoming *Sutton Library Computer Fair* at the Central Library, St. Nicholas Way, Sutton, Surrey SM1 1EA on Friday 16th (9.30am to 8pm) and Saturday 17th (9.30am to 5pm) September 1983.

The last *Sutton Library Computer Fair* was a great success and many exhibitors are expected. The Association of London Computer Clubs will have a stand.

The Fair is being organised by Sutton Library, and enquiries for stands should be addressed to Peter Smithson at the Library. (Tel: 01-661 5027).

David Wilkins, Secretary Sutton Library Computer Club

Be properly addressed
Lowe Computers, 1983
Lowe Electronics Ltd
Chesterfield Road,
Bentley Bridge,
Matlock,
Derbyshire DE4 5LE

Who Dunnit?

Our Client, Lowe Computers has received the enclosed slip from one of your readers in Walsall.

As you can see, the reader has forgotten to fill in the name and address section!

Is there any possibility of your editorial team finding room in the next issue to print a message to this reader, perhaps with a picture of the envelope and style of writing asking him to contact Lowe again — with his address? They are keen to provide a good reader reply service and the message may bring a smile to other readers' lips!

Our thanks in anticipation of your help.

Penny Hett,
East McFarland Advertising

Bring a smile to our lips?
Goodness me no. This is serious and should be taken seriously.

Now, we want whoever it was that didn't fill out the coupon to own up this minute, otherwise all our readers in Walsall will be sent straight to bed without any tea.

We are doing our bit by publishing, at enormous expense, a shot of the culprit's envelope. If you recognise the writing as yours then please come clean. If you think it belongs to a friend

then please let the authorities know. Your information will be treated in the strictest confidence.

We're actually considering turning this into a new Whodunnit game, **Hunt the Punter**, where the entire population of Walsall is lined up against the wall and sequentially exterminated with photon torpedoes until one of them can be persuaded to confess to depriving Lowe of a potential Colour Genie customer.

See the evidence above ...

Champion review!

Just a brief note to let you know that I felt Mike Gerrard's review of *Champions!* was the fairest, most informative and most accomplished appraisal of one of our programs to be published in any magazine.

Had Mike been gushing about the program, I suppose you would be inclined to take a letter of this nature with a pinch of salt. It wasn't ... so I hope you don't.

I think I can claim to be the world's most experienced *Champions!* player, and I earned my living from writing for 16 years, but I could never have hoped to capture the atmosphere of *Champions!* with half the effectiveness of Mike's review. Harry Whitehouse, Peaksoft

Strip Poker

I have been most impressed with the wide ranging debate over the Strip Poker program in recent issues. As the person who wrote the original review I think it is time I had my two-penny worth.

We seem to have lost sight of the fact that the program is just a game of poker. The fact is that the computer does play a technically good game and it does take some time to remove the young ladies' outer and inner apparel. In fact, I seem to remember the esteemed editor of this august periodical taking most of the afternoon trying to get the clothes off one of the ladies for the photo session. Need I say more than he in fact failed miserably.

I think that the general consensus of opinion that day was that the Strip part of the Strip Poker added a bit of competition to what would otherwise have been just another boring card game on computer.

It is at this point that I must ask if Mr. Banks has even seen the program run or did he just base his comments on the photographs published alongside the review. I would not go so far as to call the program "tacky soft porn", either. It really does not go far enough to even qualify for this tag. It is, after all, just a computer program.

Ron Stewart

I could argue this subject to death, though I doubt if Mr Editor May would let me. However, let's try one or two points following Ron Stewart's letter. I'll try to keep them brief.

1. To say, Ron, that Strip Poker is 'just a game of poker' or 'just a computer program' is about as defensible as saying that setting off a bomb in a tightly packed airport departure lounge is an efficient way of upsetting people. The only difference is one of degree. Now, this is only a personal view, but ... there can be a lot right when consenting adults (of any gender) play strip poker together for real, all three-dimensional like. There is something odd (my word is tacky) in someone playing against a computer and a two dimensional image (especially when the blurb sent out as publicity material shows a man sitting in front of a screen and obviously losing).

2. It would be very easy to put in bits that could come straight from the 'Feminists Diatribe Handbook' and it would be just that. However, some of those women do have a point. As I have said on this subject before, I like women who are both three-dimensional and people. I don't go for women who are two-dimensional and object-oriented. Games like Strip Poker just show these object-images as 'things' to be played with. Yet the image is of something tangible, and it is a far easier step than most people accept for the apparent responses of the image to become expected, and then perhaps demanded, in other examples, especially the live ones. That, to me, could be defined as "soft porn" in this particular context. (In other contexts, it sometimes gets called "advertising"). Given that, I don't feel it relevant whether I saw the program or not.

Just out of interest I wonder what some women readers feel about this?

Martin Banks

SILICON TIPS

Handy Hints for Micro Users
By Richard Howell

So you've taken the plunge and bought the latest STATE-OF-THE-ART machine

Unfortunately, the "state of the art" is anything but static!

Don't despair. You can usually upgrade by buying "add-on" bits

But eventually it begs the question

...WHEN IS A MICRO NOT A MICRO?

ANOTHER BRAINWAVE!!!

Now you can write your own...

ARCADE GAMES

For your

New Brain

COMPUTER

with

NEWBAS

BRAINWAVE'S NEW Z80 MACHINE CODE ASSEMBLER

- * Written entirely in Machine Code.
- * Superfast—assembles 50 lines of source text a second !
- * Comprehensive Tape handling routines.
- * 20 Error messages—displayed in full—no tables to look up.
- * Full editing facilities.
- * Renumber
- * Wide range of pseudo—operations.
- * Runs assembled Object Code without returning to basic.
- * Deletes all comments with a single keystroke.
- * Accepts over 1000 lines of source text.
- * Will accept HEX, OCTAL, DECIMAL, BINARY, LABELS, and MATHEMATICAL EXPRESSIONS.

ALSO INCLUDES:—

- * FULLY COMPREHENSIVE MANUAL—IDEAL FOR BEGINNER OR EXPERT.
- * CONVERSION DETAILS FOR TANDY TRS80 PROGRAMS.
- * INCLUDES A BEGINNERS PROGRAMMING SESSION.

PRICE INCLUDING TAPE AND MANUAL £40 FIRST CLASS POST & PACKING INCLUDED

There's one
game you should play
with a home computer
before you buy it.

If you're looking for your first home computer, may we make a suggestion.

Tear out this page.

And ask these questions of every computer you look at.

1) Is the basic price reasonable, say under £180?

2) Does it work with a monitor as well as with an ordinary UHF T.V.?

3) Does it include a basic training manual that doesn't require a science degree to understand?

4) Does it have colour?

5) And sound?

6) Does it take cassettes?

7) And cartridges?

8) And can you operate them with joysticks working directly off the basic unit?

9) Does it have a professional quality keyboard that's guaranteed for twenty million depressions (and no headaches)?

10) Does it have colour graphics that are capable of producing detailed pictures?

11) Is the case robust enough to stand up to the kids?

12) Does it use a standard language that's not a million miles away from English?

13) Is there an expanding range of high quality software available from the makers?

14) Does the software include educational programs for adults as well as the very young?

15) And is there software

20 Questions.

sophisticated enough to satisfy the experts?

16) Does it use the most up to date technology, for instance the 6809E microprocessor?

17) Will it drive a standard printer directly from the basic unit?

18) Is it made in the UK?

19) And for the basic price

will I get an easily accessible, yet large memory of at least 32K?

20) Or will I have to add lots of extras (and lots of money) for that much?

After you've finished pestering every computer salesman in sight, compare your answers to these, courtesy of the Dragon 32 (this is, after all, an ad for the Dragon).

Questions 1-19. Yes, yes, yes,
yes, yes, yes, yes, yes, yes, yes,
yes, yes, yes, yes, yes, yes, yes,
yes and yes. Question 20. No.

If you're thinking that that's a lot of computer for the money, you'd be right.

However, when you come to read the handbook you'll soon realise that something's missing.

The jargon usually associated with computers.

You see every part of the Dragon has been carefully designed to be easily understood, even by total beginners. Yet it has all the features an expert could want. Just ask it.

T.V. not included in price.

DRAGON 32

The first family computer.

Here at last...The

Acorn has finally unwrapped its long-promised Electron. At £199 and is likely to be the subject of more interest than any other this year. Hazel James and S

The Electron is finally here and while some other magazines have looked at pre-production versions we are proud to present the first full review of the version you will be able to buy in the shops. And we also have an interview with Acorn's marketing manager, Tom Hohenberg.

During our exclusive interview back in July last year, Chris Curry led us and the rest of the waiting multitudes to believe that the Electron would be on the shelves in October or November 1982. It will in fact be launched at the Acorn User Show in August, and will be on the shelves in September or so Acorn claims.

The only High Street distributor, at least for the immediate future, will be W H Smith, but orders have also been received from other distributors around the UK.

Our first question, then, had to be — why the terminally long delay?

"We shouldn't have talked about the machine a year ago," admits Hohenberg. "The product simply didn't exist — it was just a twinkle in somebody's eye. We were expecting to produce the machine in May this year, but there was a production

problem with one of our suppliers."

If this was the case, then why did Acorn let the cat out of the bag so prematurely?

Could the answer be that Acorn was trying to influence people not to buy the recently-launched Spectrum, but wait to spend their readies on the superior specification Electron?

Curry told us last year the machine

Size has been kept to a minimum by using an external mains transformer integral with the mains plug.

would cost in the region of £150, which would have been right in Sinclair territory. In the event, the price will be £199 including VAT, so anyone who's waited this long has some justification for feeling slightly peeved — especially since the Sinclair has now dropped to around £130 for the 48K version.

However, we would be the first to admit that the Electron's specification is impressive — dare we say it was worth the wait?

Here is the final spec, so settle down, read and judge for yourself.

The first thing you notice about the Electron is its small size — it is about the same shape as the keyboard on the BBC Micro, only not quite so wide. Size has been kept to a minimum by using an external mains transformer integral with the mains plug.

The power supply arrangements are disappointing, especially for a machine costing £199. That the power supply unit itself is external is perhaps forgivable, but two economies in particular may turn out to be false.

The lack of a switch, either on the computer or on the power supply itself, is bound to mean unnecessary wear and tear on the socket where the lead plugs into the computer. On the Spectrum, one of the Electron's main rivals, this has been known to lead to infuriating crashes, with the user losing his program (invariably before saving it on cassette).

Another complaint is the way the power supply plugs into the mains. It does so directly, without the benefit of a cable and

e Acorn Electron...

and
and

offering software compatibility with the BBC micro this machine

Simon Craven take the lid off Acorn's new computer and ask was it worth the wait?

a conventional plug, as employed by the Sinclair power unit. Although all the parts are sufficiently well made to be safe, such an arrangement is bound to be less positive and less convenient than having a separate plug.

There is a 56-key keyboard with 10 programmable keys. Along the left hand side of the unit are a cassette socket (1200 baud) and outlets to an RGB or black and white monitor, and a colour or black and white TV.

The keyboard is not quite up to BBC standards, being of the less expensive type whereby the key must reach the end of its travel to produce the required effect. On more expensive keyboards, the depression of a key to within a few millimetres of full stroke is sufficient to generate a character. In fact, the Electron's keyboard is just like that of the Lynx — indeed, it would not surprise us to learn that the two units came from the same supplier.

Many potential Electron users are those with Sinclair machines who want something more versatile. The inclusion of tokenised keyword entry is perhaps

intended to entice them away from their Spectrums. With the comprehensive set of abbreviations in the BBC Basic run by the Electron, and the many functions available by using control characters, the two-key entry system (press FUNC with L to LIST, for example) offers less of an advantage to Electron users than to those with a Spectrum.

The Electron scores heavily over rivals such as the Commodore 64 in ease of use of the function keys.

The familiar red user-definable keys of the BBC Micro disappear, but their function is taken over by the numeric keys on the top row of the keyboard. Pressing FUNC with one of the numeric keys enters whatever the user has defined that key to be.

Incidentally, the Electron scores heavily over rivals such as the Commodore 64 in ease of use of the function keys. All you do to redefine key 4 is enter *KEY4 followed by the new definition.

The Electron has 32K of user memory, with 32K of ROM (including the Basic interpreter). Like the BBC, the Electron has a 6502 microprocessor running at 2MHz, and BBC Basic is standard.

Electron software is upwards compatible with the BBC, but not all BBC cassettes will run on the Electron.

Acorn has already provided a number of software houses (Hohenberg wouldn't let on exactly who) with pre-production models of the Electron, so they can develop lots of software for it. However, the first batch will be from Acornsoft, Acorn's software arm.

The cassettes will be "60p to 70p cheaper than the BBC versions", and for starters will consist of *Monsters*, *Snapper*, *Meteors*, *Chess*, *Starship Command*, *Hopper*, *Draughts & Reversi*, *Tree of Knowledge*, *Turtle Graphics*, *Personal Money Management*, *Creative Graphics*, *Graphs & Charts*, *Lisp* and *Forth*. The last four will have accompanying books.

Even though the software prices are marginally down on the BBC — typically around £10 — they're still pretty high

Hardware
Review

compared with, say, Imagine's newly designed packaged cassettes at £5.50, Sharp MZ-700 cassettes at £3.95 and Sinclair cartridges soon to be released at £10. The Electron cassettes are likely to be around the £9 mark.

"Our software is very good quality," Hohenberg assures us, "I would say that the graphics capability is better than other software." Yes, but twice as good?

By the end of the year, Acorn hopes to be supplying the expansion box which will upgrade the Electron to a specification approaching but not equal to that of the BBC Micro. Unfortunately, the price is not available yet. It will include RS423 and Centronics printer interfaces, provision for games paddles (*what about joysticks?* — Ed), a slot for extra ROM memory cartridges, a disk drive and connection to an Econet network.

All the BBC Micro graphics and text modes are present in the basic Electron model except the teletext mode 7. Sound output is by means of a built-in loudspeaker.

Acorn is taking orders from dealers now, and expects deliveries to commence in mid September. So theoretically you should be able to get your hands on one then. But, asked whether the company will meet the expected demand, Hohenberg admitted candidly; "Initially, no. We already have more orders from Smiths and dealers than planned production for the first couple of months."

It all sounds boringly familiar, but it's probably put a smile on the face of Acorn's bank manager.

And who is going to buy this little winner?

"People who want a machine that will do most of the things a BBC machine will

do but can't afford £400," comes the reply, "the basic games person who wants superior graphics. It's way ahead of the Spectrum, for instance."

And it would be fair to argue that with the general price cuts by other manufacturers the BBC B, though a fine machine, is now very expensive at £400.

As you read, Electrons are coming off the production line at the rate of thousands a week.

Hohenberg foresees a lot of interest from parents whose offspring use BBC Micros at school and have been nagging Mummy and Daddy to buy one for after school. "There are thousands of BBC machines in schools. Parents can afford £200 for the Electron, whereas they can't afford the BBC," he said.

But its appeal doesn't stop there; what about the schools themselves? "Yes, I think we will sell them to schools."

As you read, Electrons are coming off the production line at the rate of

thousands a week. They are being assembled in, of all places, Malaysia, and as the production process gets into gear the volume will increase to meet the demand — hopefully.

This was probably jumping the gun somewhat, but we asked Hohenberg what would happen if an Electron broke down. It seems that you should take it back to your dealer rather than Acorn. During July and August, Acorn has been training distributors to service the machines — including Smiths. (We'll watch this one with great interest as owners have usually known more about their respective micros than the chain stores.)

Although the warranty period hasn't been settled yet — it's getting a bit late isn't it? — it's likely to be either six months or a year like its predecessor.

If you are itching to get your hands on this long-awaited machine, it looks like your best bet would be to find a major branch of Smiths and get to the front of the queue. Acorn won't start selling mail order until later — presumably when it's fulfilled all its existing orders.

SPECIFICATIONS

Processor: 6502

RAM: 32K

ROM: 16K operating system, 16K Basic

Graphics: six display modes, four including graphics. Resolution between 160 x 256 and 640 x 256

Colour: eight colours, plus flashing combinations

Sound: one music channel, one white noise channel

Price: £199 including VAT

Until then, you can always go along to the Acorn User show on the 25th to 28th of August and join in the scrimmage to get your hands on one. Wouldn't it be funny, though, if the Electron didn't turn up after all.....?

The first reaction of any BBC Micro user when confronted with the Electron is bound to be how close the similarities are. The main difference from most users' point of view is that the teletext display mode (mode 7) is missing.

For the uninitiated, the BBC and Electron use a system of different display modes, each allowing the programmer to select his own compromise between the complexity of the display required (degree of graphics resolution, number of colours etc), and the amount of memory reserved by the display. This allows a great deal of flexibility, and makes the Electron a great deal more versatile than its competitors.

The advantage of the BBC's Mode 7 is that it only uses up to 1K of memory, making it ideal for long programs which do not require complex graphics. Many programs such as adventures will therefore have to be simplified for use on the Electron.

On the positive side, the Electron is designed so that BBC-only commands slip through ignored, rather than stopping the program. Selecting Mode 7 merely puts the machine into Mode 6, and any teletext graphics symbols are reproduced as random blobs.

The same principle applies to the Electron's sound facilities. Although they

are not quite the same as those of the BBC Micro, all BBC sound commands are permitted, even though they might not do anything. The upshot is that most existing BBC arcade games run on the Electron — we tried half a dozen cassettes, and only one which relied heavily on Mode 7 refused to run correctly.

To get down to specifics, the maximum graphics resolution of the Electron is 640 x 512, there are eight screen colours with eight extra flashing combinations, and there are four independent sound channels. The sound comes through an on-board speaker, which is unusual for a micro in this class. The Dragon and the Commodore machines put their sound through the television set, giving the user easy control over the volume. The advantage of an internal speaker is that using a monitor does not mute the computer, but this will not be important for many prospective Electron purchasers.

In addition to the manual, the Electron is supplied with a demonstration cassette containing 14 programs.

The Electron has an excellent Basic by any standards, with features like named procedures making programming much easier to understand for the novice. The long variable names are a great improvement over those offered by the Microsoft-based competition.

Although the Electron is very fast (about 60 per cent faster than either the Commodore 64 or the Dragon), it is slower than the BBC. The unfortunate effect of this is that BBC games software will run more slowly on the Electron. It is quite likely that the major software houses will re-write machine-code routines to make their Electron games more comparable to the BBC versions.

Another advanced feature inherited by the Electron from the BBC is the loading and saving of programs or data on cassette. The amount of information offered by the system is exemplary, and the user is kept informed about the progress of the load. One feature unique

to the Acorn machines is that if something should go wrong in the middle of a load, the tape can be rewound a short way for a second shot at the tricky area, instead of having to start all over again.

As many of those contemplating the purchase of an Electron will be complete newcomers to microcomputing, the standard of the documentation with the machine is of great importance.

In this area the quality is mixed. The manual itself is reasonably thorough, covering the Basic and the built-in machine-code assembler in detail, but the omission of an index is a major fault. Let's hope that a future edition of the manual will correct this (though with the number of delays encountered in getting the Electron ready for release, Acorn might reasonably have been expected to see to such things before now.)

In addition to the manual, the Electron is supplied with a demonstration cassette containing 14 programs. Most of these are simple games which help the first time user to find his way around the computer. The quality is very high, and these programs will be more than enough to keep the proud owner happy for a week or so.

Meanwhile, the process of learning simple programming will be aided by another 138 page book. "Start Programming with the Electron" is a fairly standard "teach yourself Basic" text, dealing with most aspects of Electron programming including graphics and sound. Although there is some degree of overlap with the manual, it is generally helpful and well written.

COMMENT

At £200 the Electron is a sure success. It has an advanced specification, a reasonable software base, and the success of the BBC micro working for it. For anyone who uses a BBC Micro at school and wants to run the same programs at home, the Electron at £199 is much better value than the BBC B Micro at £399. In fact the BBC model A has effectively been dropped and the BBC B now looks very overpriced.

So the BBC B Micro is bound to lose a lot of sales to the Electron, then, but what are the other main rivals?

The Dragon 32 at £175 now looks very dated. Despite a loyal following, it is bound to lose out because of the BBC bandwagon. The pulling power of a cheap micro which is compatible with the computers children use at school may well be stronger than Acorn bargains for — it will be interesting to see if supply of the Electron becomes as big a problem as it was for the Spectrum and BBC Micro.

The Commodore 64 which is now just over £200 is a more potent rival. It is already very well supported by manufacturers of both software and supplementary hardware, and Commodore's new policy of producing several versions (including a portable model and a special educational model) should make the 64 one of the market leaders. How far Commodore deserve this market share in terms of the technical merits of the 64 is another question.

The Spectrum 48K at £129 is probably not at much risk, even though it was Acorn's original target. At the old price of £170 the balance would have been tipped in favour of the Electron, but Sinclair seems determined to make the Spectrum unbeatable value for money at the cheaper end of the market.

And coming soon

This Autumn should see the debut of several young pretenders to the home micro crown. What are their chances in this increasingly crowded market?

Atari's range

News has reached us of four new computers from Atari — the 600XL, the 800XL, the 1400XL and the 1450XL. The best news of all is that these machines will operate all the software that runs on the present 400 and 800 machines. This is almost an industry first and Atari is to be congratulated for its efforts in this respect. The company is also lining up a number of new peripherals, but more of these later.

The 600XL looks very much like the 1200 in design. The main case is moulded in white plastic with the keyboard and its surrounding areas in black. A cartridge slot is provided above the keyboard and joysticks etc are plugged in at the side of the computer.

Along the right hand edge of the console are the specialised function keys and the power on/off switch. Amongst these keys is the HELP key first seen on the 1200 which provides additional information and menu screens at the touch of a button.

Technical specs are very much like the old 400/800 computers and at the time of going to press we are not sure whether the computers have more player/missiles etc available. The main specs for the 600XL are as follows: Memory — 16K RAM expandable to 64K RAM with 24K ROM expansion module which includes an expanded Basic. Keyboard — 62-key, full stroke, including four special function keys and a Help key. The character set includes selectable international characters, notably those used in Germany, France and Spain. CPU — this is a 6502C running at 1.79 MHz. Graphics — 11 graphics modes with 256 colours, 128 of which are displayable at any one time. Maximum resolution of 320 x 192. Antic modes will also be directly available from Basic. Sound — four voices with a three and a half octave range. Output through the TV speaker.

That's the basic spec, but we would imagine that Atari has built in one or two other little goodies for us. We would also expect the computers to have better colour saturation a la 1200. The 800XL has an identical spec except that it comes with 64K as standard and it is slightly larger in size.

The real revolution in the Atari range comes with the 1400 and 1450 computers.

One again the basic specs are the same except that the 1400 and 1450 have four programmable function keys. These also have 12 pre-programmed instructions. Both the 1400 and 1450 have a voice synthesiser chip built in which will be programmable from Basic and will be used

by many new programs from Atari. In this respect we can expect to see a large range of educational software being made available.

In America the two top-of-range computers have built in modems but obviously these may not appear in the UK because of our different telephone system. The British computers may have a modified modem of some sort built in.

The 1450XLD has a built-in double sided double density disk drive plus space for another drive to be installed. The disk uses DOS III and each side of the 5 1/4 inch floppy will hold 127K of information. The drives will also sense if an old single density disk is being used and switch automatically. The 1450, obviously aimed at the business market, is big and butch enough to support a monitor on its back.

The 600XL and the 800XL should be available in this country before Christmas and the 1400 and 1450 some time in the new year. Prices have not yet been set but they are expected to be higher than US prices. In the States the 600XL will sell for \$199, and the 800XL for about \$299. The new 800XL has no die-cast metal structure and is probably made on a single board instead of the three that can be found in the present 800.

Your 810 disk drive and 410 cassette will not be junk if you decide to upgrade, either. Both will operate with the new computers.

As well as the computers, Atari is releasing a number of new peripherals, the most notable of which is a CP/M expansion module that will plug into all computers old and new.

The 410 cassette recorder has been restyled and is now called the 1010. The 810 disk drive has been replaced by the 1050 drive. This is a dual density, single

sided drive using 5 1/4 inch floppies. Each disk will hold 127K bytes of information. The drive also has automatic switching between single and what Atari calls enhanced density disks. Up to four of the drives can be chained together.

Atari has three printers in its new range: the 1025 which is an 80 column printer; the 1020 which is a four colour text and graphics printer; and the 1027 which is an 80 column letter quality printer using an Elite 12 typeface.

On the lighter side a touch tablet is being produced. Atari's dislike of the light pen has been known for a long time. Rumour has it that a lawyer once said that Atari could be sued if someone managed to poke one through a TV set and injured themselves.

The software side of things has not been forgotten either and a new educational series will be available soon. Atari has tied up with Disney to produce *Mickey in the Great Outdoors*, two adventures using the cartoon character to help word recognition and number skills. The series will go on to use Peter Pan and other Disney characters in teaching science, social studies and maths.

Microsoft Basic is coming out on cartridge. This does appear, however, to be a cut down version of the one currently available on disk and it looks as if an extension disk will be included in the package to expand it. Yes, I know it seems daft but there it is!

Staying on the language front, Atari will also be producing Logo on cartridge. One can only assume that Atari's Pilot has not gone down too well in educational circles.

On the games side, *Eastern Front* will soon be on cartridge as will *Caverns of Mars*. New games will include the superb

Pole Position for all budding racing drivers and *Joust* where you must knock other players or the computer off Buzzards, while you ride on an Ostrich. (Who thought that one up?). There's also *Donkey Kong Junior* where Kong's son pursues Mario through the jungle; *Pengo* which I won't attempt to describe as it's too bizarre and *Ms Pac-man*.

A new sports line will see us playing Tennis and Soccer and perhaps American Football if the game takes off in this country. I look forward with anticipation to the Soccer game, local rumour has it that the ball can be chipped over players heads when passing. Move over Dalglish your time has come.

Tandy MC10

The Tandy MC-10 is the latest in the long and bewildering line of Spectrum clones. Rubber keyboard, one word entry, 32-column display. Sound familiar?

The price is set at 'under £100'. Exactly how far under is not currently clear. Like the Laser, this machine offers only 4K of memory, so it would be as well to budget for the 16K RAM pack.

The machine does boast an RS232C interface, however, and will give access to a fair number of commercial printers. And the CPU is the 6803. Eight colours are available and — yes — the keyboard clicks.

The machine is at least assured of a reasonable number of retail outlets, since there are something like 350 Tandy shops throughout the UK. And the benefits of large back-up are likely to prove important in generating new software for the micro. Software is, according to Tandy, "available in the near future," and it is claimed that, "virtually all standard colour Basic programs" for the TRS-80 (4K) can be used on the MC10.

Coleco's Adam

Like Atari, Coleco seems to feel that it had unnecessarily limited itself by marketing a dedicated games console. It is launching an upgrade of its existing ColecoVision games module which will amount to a complete home computer system.

The system is called the Adam, and it in effect inverts the current pricing policies of computer manufacturers. For \$600

Americans can now buy a system comprising a detached typewriter-style keyboard, a memory module, two games controllers, and (wait for it) a daisywheel printer with built-in word processing software.

The Adam will be available here from the end of September either as a complete, one-shot system or as an add-on for existing ColecoVision owners.

Anyone who has seen the Coleco Vision games console in action will feel confident of the Adam's video capabilities. The ColecoVision has some of the best games software around, and the Adam can run all of it, boasting 16 colours, three sound channels and the ability to display 32 sprites simultaneously.

The heart of the system is the memory console. It houses a remarkable 80K of RAM, with provision for an additional 64K memory module. The memory console accepts ColecoVision games cartridges and, most remarkable of all, has a drive for stringy micro floppy Datapacks.

For the uninitiated, a stringy micro floppy is an endless loop of tape, similar to an ordinary cassette tape, which runs at very high speed past the read/write head. It's basically a poor man's disk system, and Coleco's success with the set-up will add to the embarrassment down at Sinclair Research where they've been struggling for months over the very similar Microdrive.

The two games controllers will be familiar to ColecoVision owners. Each features an integral joystick, two fire

buttons and a touch sensitive numeric pad. There is provision for one of these controllers to be fixed to the keyboard for cursor control and rapid number entering.

And an expansion module is available to enable the machine to accept games cartridges from Atari, ActiVision, Imagic, Parker Brothers and others.

The system's games playing ancestry is also apparent in a second expansion module featuring a steering wheel, foot-operated accelerator pedal and free *Turbo* game cartridge. And two other games controllers will be made available, including a 'roller controller' (not to be confused with a mouse) which allows speed control of the on-screen character.

And if all that isn't enough for you, then ponder the attractions of a ready-to-go word processing package built around an 80-column daisywheel printer with its own ROM-based SmartWriter word processing software already built-in.

Early reports suggest that the printer is based on the Smith-Corona TP-1 printer. Whatever the truth of that, the machine has a friction feed mechanism for paper up to nine inches wide. A cheap tractor feed mechanism is promised soon.

The Adam is CP/M compatible, and the makers promise to supply CP/M software on Datapacks or on the coming-soon disk drives. Coleco also says that many programs in Applesoft Basic will run on Adam.

And the verdict? Well, if the machine holds its US price of the equivalent of £400, and if the specifications hold good, then it has every chance of being a winner.

Any snags? Yes. The ColecoVision cartridges cost between £28 and £30. Indeed, the whole Adam system might be seen as a lost leader for the eventual software sales.

Any last niggling little uncertainties? Yes. Will all these games playing facilities in ROM really be controllable from the keyboard?

Alphatronic

The West German company Triumph Adler is likely to be better known to most people for its typewriters than for its computers, although the company has been manufacturing business machines for some years.

Triumph Adler has now launched its first personal computer, the £400 Alphatronic PC. It has a Z80 processor, 64K RAM, 32K ROM, a professional keyboard with six function keys and a cartridge port, and has the option of another 16K of RAM.

Outputs comprise RS232, Centronics, monochrome TV, RGB and monitor and floppy disks. The machine can operate CP/M, and a disk drive is already available. Eight background and eight foreground colours can be displayed.

The company hopes to have around 400 programs — half educational and half games — available for when the machine becomes publicly available in October.

Laser

The Laser, to be sold through the Computers For All chain of retailers, is the current holder of the title Cheapest Colour Computer. But the £70 price tag has only been achieved at the cost of some pretty drastic corner-cutting.

Made by the Hong Kong company Video Technology, it offers a Spectrum-style rubber keyboard, a Z80A processor, 16K ROM and one sound channel. So far so good.

But the graphics resolution is limited to a chunky 128 × 64, and the RAM is downright claustrophobic at 4K.

The Laser boasts one-touch keyword entry, and there are promises of joysticks, a Centronics interface, a four colour printer and a 64K RAM pack. The machine has an uncanny resemblance to the Textet, reviewed in our April issue, and none of the fundamental snags outlined then need to be re-written.

A 16K RAM pack will prove essential for any serious programming, and at £30 this add-on drops the machine into that arena where the Spectrum and Oric are currently logging it out.

In such company, the Laser's low resolution graphics, lack of established software support, and generally unremarkable specifications are likely to prove fatal.

Memotech MTX500

The Memotech MTX500 is a big black slab of a machine, offering the experienced programmer some of the most sophisticated on-board software currently available. It also offers painless step-by-step expansion up to full business capacity.

The basic machine is housed beneath a professional 79-key keyboard. It's an impressive-looking beast, housed in Memotech's familiar black anodised aluminium.

The MTX500 runs a Z80A processor at 4MHz and has 32K of RAM, expandable to a massive 512K of paged RAM. Its 16K ROM contains the MTX Basic and, as part of the machine's consistent support for the programmer, a Z80 assembler/disassembler is built in. Machine code routines may be included within a Basic program, and can be stepped through one instruction at a time to help in error-trapping.

The machine's 'front panel' display enables the programmer to examine and manipulate the contents of the computer's memory and registers, useful again in the development of machine code programs.

Besides MTX Basic, the machine has

two other built-in languages. To aid in the manipulation of the 16K of dedicated video RAM, the 500 can run Logo, the graphics language. The computer has a sprite facility, enabling the easy creation of user defined graphics characters.

Sprite characters appear to run independently of the background graphics, and can be programmed to move from and to given positions at a certain speed, and then virtually forgotten for programming purposes. Priority can be written-in so that one sprite will pass behind or in front of another, and collision checks can be run.

Just to reassure you that the MTX is not wholly for sophisticated software authors, Memotech has included a third resident language for programmers at the most elementary level.

It is called Noddy and provides "a very simple method of programming the computer to display information or ask questions and then move on to another display depending on the previous response".

Eight virtual screens are available, which help the programmer in the organisation of the display. The display can be 48 × 24 in text mode, or 32 × 24 when mixed with graphics. Graphics resolution is 256 × 192, and 16 colours can be displayed at the same time. An 80 column video board is available.

Standard outputs are Centronics, twin joysticks, 2400 baud cassette, TV, video, hi-fi for the three voice sound, an uncommitted I/O port and a dedicated games cartridge.

The obvious competition for this machine is the BBC, and in certain lights the MTX500 makes Acorn's offering appear over-priced and half-finished. But the BBC is by now very heavily entrenched, being almost the Government-recommended micro.

The marketing manager of Memotech's US division believes the MTX500 is a machine for the second time buyer, and until good games software comes along to demonstrate the machine's capabilities to the uneducated eye, it is likely to be the experienced user who will most readily appreciate its impressive specifications. ■

AT LAST!

THE BROADWAY DISC DRIVES FOR THE BBC MICROCOMPUTER

- Dual 800K. Single 400K.
- Uses new Mitsubishi half height drives.
- Manual, format disc, and leads included.
- Choice of colours — oatmeal & chocolate.
- Available NOW — direct or from selected dealers.
already in use by
many leading colleges
and universities.
- Price — 800K £599 + VAT
400K £325 + VAT

SHARP MO

OVE

Sharp has never made a really big impression on the home micro market. But its new £250, 64K MZ-700 could change all that when it is launched later this month. We put it through its paces and assess its chances.

The Sharp MZ-700 is a big, heavy machine. In terms of physical size, it bears quite a similarity to the BBC Micro, being about twice as large as the Commodore 64, perhaps the main rival, and its weight (at least with the added printer and cassette recorder) is enough to test the strength of many a desktop.

The heavyweight impression continues when you try out the keyboard. There are 69 keys in all, the normal QWERTY keys supplemented by a row of five blue function keys at the top left of the machine, with the four cursor keys and INSERT and DELETE on the right hand side.

The feel is very good, with a heavy, well-cushioned movement making it easy to touch-type at high speed. The space bar on our example, however, feels as if it belongs to a different machine — its action is annoyingly light in comparison with the others, and it announces its use with a rather cheap-sounding clatter.

The layout of the keys is reasonably standard, but one particularly odd irritation is the un-shifted question mark.

This takes quite a bit of getting used to, especially for anyone who normally uses this as an abbreviation for the PRINT statement in Basic.

The four cursor keys are mounted in a cross configuration in their own area of the keyboard, making cursor control very easy, and providing a workable alternative to a joystick for playing games.

Another thoughtful touch is the clear plastic strip above the five user-definable function keys. The user can remove this to insert his own labels as a reminder of what the keys are programmed to do in any given application. The functions keys are remarkable for the length of the commands which may be assigned to them — a generous 255 characters.

An immediately noticeable feature of the MZ-700 is that the graphics characters are printed on the front surfaces of the keys, the selection between alphanumerics (ordinary letters and numbers) and graphic characters being made by depressing the GRAPH or ALPHA keys.

As we shall see later, this camouflages the Sharp's graphic capabilities to some extent, since the export models of this

VOICE INPUT MODULE

for Apple II® IIe® and others

Voice Machine Communications has designed a phenomenal new voice recognition system allowing greater productivity for the handicapped. Now you can speak out and be recognized. The AVIM offers you unlimited usage at an unmatched price and quality.

Also compatible with Franklin Ace and Basic

**An exciting and
practical new product
to use on your personal computer**

DESCRIPTION

**VIM FOR APPLE II
CONTAINS:**

**Voice Input Module 2020C
with:**
16 channel audio spectrum
analyzer
6803 high speed
microcomputer
8K Bytes of RAM, 4K Bytes
of ROM

**Voice Utility Diskette
with:**
Vocabulary builder/editor
Prompting vocabulary trainer
Recognition software
Vocabulary tester

**Microphone, Users Manual
and all necessary cables and
connectors**

FEATURES

- No application programming necessary
- Near perfect recognition, 98% +
- Apple II® slot compatible board
- Unlimited vocabulary using eighty word/phrase subsets
- Diskette software allows immediate recognition for applications
- Recognizes anybody's voice easily
- Multi-lingual recognition
- Allows concurrent input of voice and keyboard
- Converts spoken words to commands
- Recognition and memory on the board

APPLICATIONS

The VIM is designed to add voice input to any existing Apple II application:

Graphics
Word Processing
Data Input and Retrieval
Education
Business
Industrial Automation Programming
Testing & Measurement Control Systems
Games & Entertainment
Local Environment Control

CASCADE GRAPHICS DEVELOPMENT

179 Lower Richmond Road, Richmond, Surrey
TW9 4LT Telex 923921

Voice Machine
Communications
Inc.

Japanese machine have an additional 256 graphic characters available to them.

Moving towards the rear of the machine, it becomes clear why the Sharp is twice as deep as a Commodore 64. The built-in, four colour printer/plotter dominates the machine, and the integrated cassette deck slots in neatly to one side.

This policy of providing built-in peripherals is not new to Sharp, as those familiar with the integral monitors and cassette units of the MZ80 range will testify, but on this latest model its implementation is much more sensible.

For a start, you don't have to buy the add-on bits and pieces if you don't want them. The basic price of £240 is for the bare machine, and our experiences showed that the interface provided for use with ordinary recorders worked perfectly well. Those wishing to use printers other than the £135 miniature are catered for, since there is a plated-over socket marked PRINTER at the back of the machine. This will accept the MZ80A printer, and several other

types of printers should be adaptable.

The omission of the monochrome monitor which was a part of previous Sharps is also a sensible move in a market dominated by demand for colour graphics. Supplying a colour monitor would have been prohibitively expensive, but the rich and successful will be pleased to find the outlets for connection to RGB colour monitors and green screen monitors along the rear edge of the machine.

A most unusual, and surprisingly useful feature is the volume control for the internal speaker. We frequently complain about the lack of any sound adjustment facility on computers which do not use the television set as a loudspeaker, but the Sharp allows for midnight Space Invaders sessions while ensuring that "loud" can be very loud indeed!

Another advantage of this approach is that the MZ-700 does not become mute when connected to a monitor.

More common-sense thinking is apparent in the extra cassette ports fitted — although the Sharp cassette unit is very neat and efficient, and reasonably priced at under £40, its use is not compulsory. Most normal small cassette units will cope perfectly well. It all seems to be part of a deliberate policy of giving the user as much choice as possible in the way he or she wishes to use the system.

The other main features of interest on the crowded back panel are the twin joystick port (unfortunately not compatible with the Atari/Commodore standard which is finding favour with manufacturers of specialist custom joysticks), and a large input/output bus for disk drives or other peripherals.

The printer/plotter is bound to be one of the Sharp's most talked-about features, especially since it is perhaps better known as the Tandy CGP 115 in this country. Actually made by Sharp, the basic mechanics of this unit have found their way into a number of re-packaged alternatives, including the recently-announced Oric printer and a forthcoming Commodore version.

FINSBURY BENCHMARK

Sharp MZ-700 v. BBC Micro v. Commodore 64

	All times in seconds		
	Sharp MZ-700	Commodore 64	BBC Micro
1.	12.3	14.1	7.2
2.	3.6	9.5	3.4
3.	9.5	18.0	8.2
4.	8.6	19.9	9.1
5.	9.4	21.6	9.5
6.	17.5	32.0	14.7
7.	32.1	51.5	21.1
8.	82.5	156.5	48.3

For those still unfamiliar with it, the printer is of neither thermal, daisywheel nor dot matrix design — it actually draws the letters on to the plain paper roll using tiny ball-point pens. This makes it rather slow, but the print quality is excellent and the process is fascinating to watch.

The amount of care and thought which has gone into making the MZ-700 is obvious from the hardware design — for attention to detail and thoughtful provision of touches such as the volume control it must be the clear market leader. But when the machine is switched on, this excellence only makes the shortcomings of the Basic more disappointing.

Its main failing is that it is not resident in ROM. Like the MZ80K and MZ80A before it, the 700 has no resident high-level language. After switching on or using the reset button on the back, the user enters the machine code monitor, and the command LOAD permits the loading of Basic from cassette.

The loading process takes almost three and a half minutes, and that can feel more like three and a half hours on occasions. This factor alone is bound to put off many prospective buyers, especially those who have had difficulty loading programs from tape with other micros. To be fair to Sharp, the cassette loading is relatively fast at 1200 baud, and only once did Basic fail to load first time on our review machine, but one wonders what will happen a few months after purchase, when the cassette itself becomes corrupted or damaged as cassettes inevitably do.

As long as replacement Basic cassettes are freely available, and preferably free of charge too, all will be well, but we would recommend sounding out your dealer's attitude before purchase.

Sharp's reason for putting Basic in RAM rather than ROM is that it gives much more scope for using other languages, and ensures plenty of memory is left for serious purposes like word processing or financial modelling.

The MZ-700 contains a full 64K of free memory, with even screen RAM held separately, and offers 36.5K of space available for Basic programs. But the two machines which offer similar facilities —

COMMENT

Sharp has never made a big impression on the home micro market, but this machine could give the company its best chance ever.

The machine's two weaknesses are its limited graphics and the need to load the Basic from cassette. Both are irritating, but interestingly become less significant the more serious the applications for which the machine is used.

At £240 for the basic unit, the Sharp must be regarded as very good value indeed, matching the Commodore 64 very closely on price and specification.

The bells-and-whistles model with built-in cassette recorder and printer works out at about £420. Again, this is good value for money, making the BBC Micro look overpriced, despite its advanced specification.

Acorn's current launch date for the Electron puts it at a few days after this issue of *Which Micro?* goes on sale. At under £200 it may well be the Sharp's toughest competition.

THE MZ-700 — A 76K MICRO WITH 4 LANGUAGES & 45 PROGRAMS FOR £215

KNIGHTS DESIGN

We have been to Sharp at Osaka, Japan three times in the last 18 months and have been closely involved in the European release of this mode. Sharp originally intended to export the MZ-700 with 256 characters similar to those on the MZ-80K. We persuaded Sharp to incorporate our character generator which gives 512 characters.

Many computers have a very limited number of characters, often just 128 and sometimes with no small letters. Some micros get around this limitation by allowing the user to define shapes but this involves complex programming. Our easily programmed 512 characters include all the original Sharp shapes with the addition of "outline" letters and numbers, space invaders, rockets, planes, tanks, cars, snakes, bullets, guns, faces, gremlins, fruit, ghosts, flying saucers, chess pieces, a TV set and the MZ-700 itself. For more serious applications we added a mass of electrical symbols including transistors, diodes, capacitors, gates, etc, plus scientific, Greek and other language characters.

All of us at Knights were involved in designing this section of the MZ-700 and we would like to publicly thank the staff at Sharp for their help and enthusiasm. It is a great honour for our British design

to be incorporated in Sharp's MZ-700 export production.

FREE PROGRAMS

Each MZ-700 from KNIGHTS will be supplied with 4 languages and 40 programs. The prices in brackets are what you will pay if you buy your MZ-700 elsewhere!

TEN of JAPAN'S best games — SNAKE, SPACE BEE, SEND ONE, PAINFUL MAN, LAND ESCAPE, CIRCUS STAR, SEARCHER, BATTLE, ROUND STREET, & SUPER PUCKMAN.

TEN KNIGHTS PROGRAMS (£34) — CRIBBAGE, SUICIDE RUN, TEACH MULTIPLICATION, TEACH DIVISION, VICIOUS VIPER, MOTORING COSTS, STATISTICS, HOME ACCOUNTS, CRASHER, AMERICAN BOWLING.

PASCAL LANGUAGE + 12 Pascal programs (£25)

MACHINE CODE LANGUAGE (£12)

FORTH LANGUAGE + 10 programs (£25)

KNIGHTS UNBEATABLE SHARP & ATARI DEALS

DEAL 700 + 4 £215 MZ-700 with BASIC, PASCAL, FORTH & MACHINE CODE languages + 45 great programs.

DEAL 700-P £111 MZ-700 four colour plotter-printer.

DEAL 700-C £33 MZ-700 cassette recorder.

DEAL A50 + 4 £345 MZ-80A with BASIC, PASCAL, FORTH, and MACHINE CODE + 50 programs to get you off to a flying start.

DEAL B3 £747 MZ-80B 76K total memory, BASIC, MACHINE CODE & ASSEMBLER.

DEAL P5 £349 SHARP P5 printer systems with all cables, character generator, interface card for MZ-80A, B or K & INVOICING + STOCK TRANSFER PROGRAM.

DEAL P6+ -389 Complete MKZ-80P6 sprocket-friction printer system for MZ-80A, B or K & INVOICING + STOCK TRANSFER PROGRAM.

DEAL MZ-80FD £599 complete MZ-80A, B or K dual floppy system with Master Disk, manuals, interface card & cables.

DEAL MZ-80A SYSTEM £1365 complete system with micro, dual disks, printer, expansion, all cards, cables, manuals & 5 languages.

DEAL MZ-80A SYSTEM + 3 £1450 as above + 3 disk programs — STOCK CONTROL for 2000 items, MAIL LIST 2000, INVOICING.

DEAL MZ-80B SYSTEM + 3 £1699 complete system of micro, printer, dual disks, BASIC, MACHINE CODE, ASSEMBLER + 70 programs.

DEAL MZ-80B SYSTEM + 73 £1750 as above + 4 DISK PROGRAMS — STOCK 2000, MAIL LIST 2000, & DATA PROCESSING & INVOICING.

Customers outside the UK and 5% for freight. UK customers get free Securicor delivery but remember to add VAT. We have sold thousands of Sharp products all over the world during the last 9 years and have never had to charge for a single repair. I wish we could find someone willing to supply cars on this basis! Ring, write or telex for our latest newsletters and prices.

the Commodore 64 and the BBC Micro — both do so in a much more convenient way.

The Commodore's approach is the more flexible — the Basic is held in ROM and overlays part of the RAM when Basic is selected, giving about 38K of program space. The BBC treats the problem differently, with its use of 'paged' ROM chips, so that Basic, word processing or any other chip-based programs can all have full use of the available RAM.

The other way in which the Sharp lags behind these rivals is in its graphics. Games programmers in particular will find it impossible to produce software with the same graphic excellence provided by the easily-programmed sprites of the

Commodore or the flexible high-resolution plotting of the BBC Micro which also offers user-defined characters.

To some extent, the Sharp compensates with an amazingly diverse set of pre-defined graphics characters. The standard 256 characters of the earlier MZ80K are retained, but those models earmarked for export from Japan get an additional, alternative character set, developed by Graham Knight, a third-party computer dealer from Aberdeen who is being charged with much of the responsibility for Sharp's MZ-700 software.

The extra 256 characters give a lot of scope in designing displays, but the inability to plot high-resolution lines between two calculated points is bound to frustrate the games programmer.

Sound is one of the Sharp's stronger points — the Basic offers control over only one "voice", but some demonstrations by Graham indicated that machine code can produce the sophisticated effects familiar from the best software for the Commodore and BBC.

The Basic does feel old-fashioned, and this can be pinned down to the omission of features such as IF... THEN... ELSE, procedures, or the REPEAT... UNTIL offered by the Oric and BBC. Some useful features are implemented, however, with the provision of error handling with ON ERROR GOTO making life easier for programmers.

Although the lack of innovation in this respect is slightly disappointing, it has one

great advantage — the MZ-700 is directly compatible with cassette software written for the MZ80K. The later MZ80A is not so tractable, but a software convertor to allow the use of its programs is due for early release.

The inclusion of commands such as CIRCLE at first implies hidden graphics capabilities, but these relate to the printer/plotter rather than the VDU display. They make it very easy to draw graphs and charts, and demonstrate just how important the printer is to the MZ-700 concept.

The command PLOT ON transfers all screen output except graphics characters to the printer, so it is just possible to use the machine without a television or monitor if you don't mind the expenditure on pens and paper. PLOT OFF restores visual output to the screen.

The manual which explains all this is one of the best we've seen. The detail is excellent, and the inclusion of circuit diagrams for the printer and cassette recorder as well as the computer itself indicates real willingness to help. The contrast with almost all other manufacturers is remarkable — only Tandy is comparable, and even the otherwise excellent Aquarius manuals provided by Mattel are lacking in technical information.

Those who really want to learn the Sharp's secrets will be delighted to see a full assembly listing of the monitor program, and an explanation of the processor's instruction set. ■

SPECIFICATIONS

CPU: Sharp LH0080A (Z80A)

Clock: 3 MHz

Memory: ROM 4K (ROM) 2K (character generator) RAM 64K (program area) 4K (video RAM)

Screen size: 40 characters x 25 lines
8 x 8 dot character matrix

Colours: 8 colours for characters
8 colours for background

Music function: Built-in (500 mW max. output)

Clock: Built-in (24 hour clock, no backup)

Keys: 69 keys ASCII standard. Definable function keys, cursor control keys

Editing function: Screen editor (cursor control, home, clear, insert, and delete)

ORIC MCP 40 COLOUR PRINTER

ORIC
MCP 40 COLOUR PRINTER

£169.95 incl.VAT.

It's here, the exciting new ORIC MCP 40, Colour-Printer. Packed with quality ORIC features to start building your ORIC system.

Superbly styled and quality engineered to provide 4 colour hard copy, for home and business use.

Just look at these leading features:

- **Quality hard copy on plain paper**
- **Superb graphics and text capability**
- **Prints 4 colours – Red, Green, Blue and Black**
- **Designed to match the futuristic style of ORIC 1**
- **Plugs straight into your ORIC – printer lead supplied**

My computer

How to get it fixed and where to go — we talk

What do you do if your machine happens to be one of the small percentage that does develop a fault of some kind? Well, as computer-minded people are more inclined to be rational, logical human beings, the first thing to do is probably panic, just like everyone else.

But once you've exhausted your supply of swear words, kicked the cat, and checked the obvious things (see Part 1 — *Which Micro?* August) like have you paid the electricity bill, what are the next steps you have to take in order to restore your micro to its full functioning glory?

If it is still under guarantee, the simple answer might seem to be just to take it back to the place where you bought it, or return it to the manufacturer in the mail, but this may not in fact be the best thing to do. Different manufacturers have different policies, and some faults can even be fixed over the telephone. This isn't some startling new offshoot of Micronet, but it's just that what might seem to you to be a fault with the computer could be something very simple, like a loose connection or a fault with the power transformer.

"Problems can often be put right over the phone," a spokesman for Dragon Data told me, "as you do get similar faults recurring which can easily be diagnosed, and many of them aren't problems with the machine anyway, so there's no need for someone to go to the trouble of returning it."

"If a fault develops on a Dragon, the first thing anyone should do is speak to someone in our Technical Department, or write explaining what the fault seems to be, and we'll do our best to sort it out. If it turns out that the machine does need to be examined then we'll put you in touch with the nearest service agent."

"We're in the process of setting up a chain of these at the moment, and have just signed contracts with several people, but it does take time to find the right agents. We'll be advertising all about this fairly soon anyway."

"At the moment, of course, all our machines are still under the guarantee period, having only come on the market last August, but there will be service agents available when the guarantees start to run out. If you've bought a Dragon from a dealer then naturally you can take it back to that dealer. Some of them, like Boots, are very helpful and will replace the machine out of stock if they can."

I asked Anton Boyes, who is responsible for the home computer side of Boots, if this was indeed the case.

"Yes," he told me, "that's our policy. We haven't been selling machines for a year yet, so everything we have sold is still within the guarantee period and so should

be brought back to us. Although we operate an exchange system, of course we'll check first that the machine actually is faulty, and it's not something as simple as a bad connection somewhere."

"Dragon Data supplies a diagnostic cartridge to all its dealers, and you can run this through the machine to check various functions. We also have set checking routines that we carry out with the other computers we sell, too."

"Once machines start to go outside the guarantee period then we're hoping to be able to offer a repair facility, though that's something that's still under discussion yet, and at the moment any faulty machines that are returned to us have to be sent back to the manufacturers — but we will replace them if we have another machine in stock."

No repair facilities

The biggest High Street micro dealer, WH Smith, has no plans to offer any repair facilities. "We're retailers, not repairers," a spokeswoman told me.

"If someone has bought something from us then they should bring it back at once and naturally we'll do our best to sort it out; but we deal with the manufacturers

on this and it's often up to them as to whether a replacement is made, or the customer has to wait for the repair to be carried out. Subject to availability, we may be able to offer an instant replacement, but we couldn't absolutely guarantee it in every branch every time. It just depends on the circumstances."

If you happen to have bought a machine by mail order and there's no friendly or even grumpy High Street dealer to return it to, what then? As the chances are that it's a Sinclair machine, I asked a company spokesman about its policy on repairs.

"There are two main loops, if you like: one for mail order and one for purchase through a retailer. For the second you should simply take it back to that dealer, as they all have their different ways of doing things. For our machines, then, the big dealers such as Smith and Boots would probably offer you a simple exchange over the counter and you'd walk out with a new machine."

"For those bought by mail order, we prefer it if the customer writes or rings first to try to explain what is wrong. There are one or two common faults that occur, such as colour drift for example, which may not be the computer but the TV it's being used with, and we can offer advice

...doesn't work

we talk to the manufacturers and dealers

on that without seeing the machine.

"If we do need to examine it then we'll provide labels and so on for returning it to our central warehouse where there's a continual repair process going on. We don't have any official service agencies anywhere, and have no plans to set any up, so the machines do have to come back to us for attention."

Acorn machines are not as widely available through dealer networks as others, and this is partly due to the fact that any dealer selling Acorn machines must also be able to provide some service back-up.

I was informed by yet another spokesman: "An Acorn dealer has to have some on-site servicing facilities, and we do provide our own training courses for this. Not everyone can fix every fault, of course, and one dealer might have to pass the machine on to another for attention, but they're all quite capable of dealing with most of the faults that are likely to occur. It is a fairly wide dealer network, and in fact when someone buys an Acorn machine they're provided with a list of our dealers for reference."

George West is the manager of the Customer Relations and Product Support Department of Atari International, which, because of its dual interest in micros and

games machines, has to deal with a variety of both software and hardware problems — including the machines that get blown up by people who think it would be a good idea to connect them direct to the mains.

"Any software problems are easily dealt with," George West explained, "as the software only has to be returned to us with proof of purchase and we'll test it and replace it. For hardware we have the Customer Relations Department here, and if there are any problems then people should get on the phone to us and explain what's wrong."

"We have a separate phone number with five lines, and that's Slough 24561, so if any Atari machine goes wrong then that's the number to ring."

"It often turns out that it isn't the machine that's at fault, of course, but if the people here do deem that it's broken down then they'll refer you to one of the 57 independent service centres that we have throughout the country, although we do also have our own service centre here in Slough."

"But when anyone buys an Atari they also get a booklet listing the service centres, anyway. All people need to do is to take their machine along to one of these, again with proof of purchase, and

they'll examine it for them. If it's out of the guarantee period then they should ask for a quote for the cost of repair. Although these centres are independent, they are all Atari trained and supplied, so we wouldn't really recommend going to anyone else."

Although you may well find a good independent repair service, there aren't too many around.

Back to the dealer

"Take your machine back to the dealer," a Commodore spokesman said, "even if it's out of the guarantee period. There's nothing much else you can do, unless you happen to live in an area like London, where there are one or two specialised repair services. But we have so many end-users that things have to be done through the dealers, really."

Because the micro boom is so new, with the vast majority of machines in British homes not even being out of the guarantee period yet, one possible method of dealing with repairs has still to be fully developed, and that is the maintenance contract.

Anyone who has ever worked in an office will know that there are many firms offering maintenance contracts for typewriters and other equipment, where for an annual payment they will guarantee to send someone round should any of the equipment happen to break down. But this form of insurance against the cost of repairs hasn't yet touched the world of the home micro.

Maintenance contracts are available on larger business machines, and one company doing this is Mills Associates (0600 4611), which told me that it deals with Commodore, IBM and Zenith machines among others.

"You only really need a maintenance contract where the repair has to be done in a short space of time, and that generally means the business user. We will do *ad hoc* repairs on the smaller machines, with something on a Commodore 64, for instance, costing about £36 to £60 for a single repair, depending on what it is. But as yet there just isn't the demand for maintenance contracts on these smaller machines. Maybe there will be in a few years' time, we don't know."

Though space only permits a look at the policies of the 'big five' micro suppliers, if you happen to have another machine then it might be helpful to check in advance what to do should yours be one of the unlucky ones which develops a fault. Of if you don't yet have a micro, then these various comments are worth bearing in mind while you're deciding which machine to buy, and where to buy it. ■

GET IT

WITH SUCH A WIDE CHOICE OF TAPE RECORDERS FOR HOME MICRO USERS WE H

Cassette decks have come a long way from the days of the giant reel-to-reel recorders which we would get as Christmas presents if we were lucky.

Now you can buy tiny Walkman (or Plodman, if you're like me) recorders that are portable, have a fairly reasonable sound quality, and which don't put too much of a strain on your flexible friends.

Faced with as many types of tape recorders as there are microcomputers, which one do you use for your own computer?

Do I Really Need One

Before plunging into your friendly hi-fi store and purchasing the latest technological marvel you have got to decide whether you want, or need, a cassette deck at all.

The answer for most newcomers to the microcomputer scene will be a definite yes. Disk drives are expensive, micro-drives seemingly belong to another age, and the only other readily accessible means of storing your programs and other information is the cassette recorder.

So, having decided that you will buy one, how do you go about making the choice?

If you've got a Vic 20 or a Commodore 64, that choice is fairly limited, as Commodore has so designed the cassette adaptor on these computers that an ordinary cassette deck will simply not plug in. Instead they offer their own C2N as they like to call it, which is compatible, and varies in cost from £25 up to £40 and beyond.

There are good reasons for using this specially adapted cassette deck. It works, is the principal one. It's been designed for Commodore computers, and those are the ones that it will work perfectly well on. They are fairly reliable, and they also have a built-in tape counter: invaluable if

you want to find any particular program quickly.

From round about the beginning of June you're not going to have any say in the matter at all. Commodore is announcing a complete package of Vic, cassette deck, and various software items, for around £139. That is all very well if you haven't got a cassette deck in the house, but most people will have, and the idea of parting with more money than necessary just because Commodore says that you must use its cassette decks is galling to most people.

However, Which Micro? can now proudly reveal that you can use any cassette deck in the world with your Commodore computer! Here's how.

Using Non-Commodore Cassette Decks on Commodore Machines

The only reason why the Commodore cassette decks are unique is that the computer supplies the power to them. Given a cassette deck with its own supply, all we have to alter is the edge connector that links us up to the computer. Looking at the connector, the terminals on it are numbers A,B,C,D,E and F on the bottom, and 1,2,3,4,5 and 6 on the top. The pin-outs are in pairs, thus:

- A-1: ground (connect this to computer ground)
- A-2: + 5 volts (this one's not used)
- C-3: cassette motor (use a remote source i.e. a plug!)
- D-4: cassette read (earphone)
- E-5: cassette write (microphone!)
- F-6: cassette switch (this one's not used either)

The only problem might be getting a suitably sized edge connector: Commodore uses an odd size for its machine. Since Commodore presumably

won't be too happy about supplying you with one themselves, the easiest solution is to get a larger one of the same spacing and cut it to fit.

Simple really!

The Problems For Non-Commodore Owners

Everything we mention here will also apply to Commodore people who want to use their own cassette deck. Just what do you look for?

Every recorder that you will use for your computer should have on it a tape counter. This will enable you to quickly search forward or backward for the program that you require, provided you've made note of the number on the counter when the program was saved! This will save you a lot of time, as trying to guess the position on the tape by simply looking at it is a very hit or miss affair, and more often than not it just won't work!

Apart from a counter, the next item should be tone control, as well as the normal volume one. As the ability of any cassette recorder to work properly with a microcomputer depends on the quality of the signal that it's sending out, you'll need to be able to adjust that signal as finely as possible. Mere volume adjustment alone would probably not be sufficient. The Sinclair range as a whole seems to be particularly susceptible to this.

After that, providing that you've got the rudiments of play, record, fast forward and fast rewind, there isn't too much else to look for in the actual deck. If you haven't got a tape counter, a remote microphone socket would be a good idea, as this allows you to actually listen to the programs on the tape as you're doing a fast forward/rewind, which would roughly allow you to gauge when one program ends and another one begins. You'll soon get to know what the beginning of a program (the header) sounds like. The rest of it bears uncanny resemblance to Lou Reed's Metal Machine Music album! Save yourself £6 on record buying and invest in a recorder with a remote microphone. Tandy's recorder, at £29.95, has this feature, but as it also has a tape counter there's not much point in using it.

Microcomputers in Particular

As Spectrums, ZX81s and 80s seem to be among the most popular micros around, we might as well start there.

I know of many people who are successfully using the aforementioned Tandy recorder, although the Smiths Computer Compatible recorder (fancy name for a fairly ordinary cassette deck), and the

Commodore's C2N model with built-in tape counter

T A P E D

WE HAVE PUT TOGETHER A GUIDE TO THE BEST BUYS, AND HOW TO USE THEM.

Ferguson 3T27
portable cassette
recorder with computer
compatibility

Triumph C15 (no, it's not a cassette), all seem to function properly.

The Triumph has the added advantage of being able to adjust the position of the tape head, in case volume and tone adjustment fails you. Badly aligned heads was a common failing on early (and not so early) Commodore machines, and would also affect any other cassette deck. It would mean, amongst other things, that you'd probably never be able to load a commercially available program. So head adjustment is a good idea. Provided that you don't have the ear and the mike leads plugged in at the same time (this causes feedback, and produces extra noise on the tape: not very sensible), the only other problem for Sinclair people is experimenting with the volume and tone controls.

Tone is normally set to maximum, so as to get the sharp edge of the signal being sent out from the micro. Volume, well you'll just have to experiment. No two micros seem to be alike on this, so it will probably take you a little time to get it right. If you have a microphone, one BBC user I spoke to recommended starting off with the volume at the sort of tolerable level you'd use to listen to a record. Any adjustment required from there will probably be fairly minimal.

On the BBC, it's easy to adjust the volume by using the BBC Welcome Tape, and trying a few times until the TAPE SET OKAY message appears on the screen.

The BBC has been the subject of many unfair remarks and rumours about the reliability of using tapes, but in reality it seems to be very tolerant (unlike the Tandy micro which seems to require volume adjustment to within one tenth of a percentage to different volume levels. One user I know has been using the

"cheapest and nastiest Sharp recorder I know!" for a long time, without any problems whatsoever.

The only problem with the BBC machine is an inherent bug in the original operating system, which you really did sent out for far too long, didn't you chaps? Every now and again (Acorn claims about 6 per cent of the time) when you're recording, the serial ULA is not initialised, and consequently the first block of program is not recorded. This means that you can't subsequently re-load your program. Always make two copies of your program to get around this, working on the old adage about lightning never striking twice.

Dragon users are in a fairly variable position. One user I know just uses the Ferguson radio recorder, and after a little playing around with column and tone has had no trouble at all. Well, there was

once, but this sort of thing happens to us all. For one commercially bought program, the tone had to be turned down from its usual maximum position before the tape would load, and then back again for everything else.

Other users however, report many problems. Sony, Aiwa and Hitachi do not appear to be liked by Dragons, nor (as with most other micros), do fairly inexpensive recorders. The time taken to reach full motor running speed is usually too long on the cheaper makes, so you'll save yourself an awful lot of aggravation by spending that extra £15 on a decent machine. A much recommended model appears to be the Binatone Radiocorder, and no one can really complain about spending 20 quid to have a properly working micro.

Anything else, well, the Panasonic Slim-line cassette recorder seems pretty reliable. Indeed, Oric specifically recommends that you use that one.

Conclusion

We've recommended some specific recorders for specific machines, that various users have been happily working with on their own particular micro, but the basics remain the same. Tape counters, microphones, and experimentation with volume and tone controls apply to all home computers. It IS worth spending a couple of extra quid to get a decent make. It will save a lot of hair tearing!

And finally, don't spoil the ship for a ha'porth of tar. Use decent cassettes, preferably C10s or 12s (longer tapes suffer from tape stretching, and consequently problems on reading back programs later), and go for a good name like TDK. That little bit of extra expense is well worth it for a trouble free life with your computer. ■

**A Galaxy of New
STAR Cassettes
making their
Screen Debut!**

The waiting's over, they're here. A sensational collection of mind warping games, created to stretch the barriers of human endeavour. Do you dare to accept the challenge of Captain Lasersound and enter into the electronic wonderland, a world where only the ultimate warriors survive.

**ZX Spectrum 16K/
48K £5.00**

Fantastic collection of arcade thorough-breds and exciting newcomers. Superb hi-res graphics make this pack a visual bonanza. This compendium starts where others finish.

by Paul A. Thomson and
Lyndon John Knowles
**ZX Spectrum 16K/
48K £5.50**

You just love eating those green eggs. But watch out, mother hen is getting angry and when she does the feathers start to fly. A fast arcade game that can make even the bravest turn chicken.

**Hummer
house of horror**
superb 3d graphics

by STEPHEN CURTIS
**ZX Spectrum 48K
£7.00**

It's too late now to start crying for help. You're on your own, that is apart from the evil spectres that frequent the House of Horror. Is there escape? Or will you be forever entombed in Hummer, house of horror!

by J. S. Bailey
Oric 1 £5.00
Fun while learning with this dual program cassette. Full colour and excellent graphics combine in a shoot-them-down concept. Only the correct answer will bring success. This cassette serves as an ideal method of introduction into computer assisted education.

by Douglas Barr
**ZX Spectrum 16K/
48K £6.00**

Using sound and graphics this cassette provides a progressive stage by stage introduction to guitar playing. Starting from the basics of tuning and going right through to song accompaniment. The graphics and sound facilities combine together to make every step clear and concise. This program is ideal for aspiring musicians.

How can you pass up a good program?

Well, we couldn't, so we are now able to offer you good quality programs for the following computers: Dragon 32, Spectrum 48K, TI99-4A, and ZX81.

DRAGON 32:

Scanner 13: Set in the city of the future, this game combines the best of arcade and adventure games. £8.45.

£8.45.

Alien Oddyssey: First two parts of an exciting new adventure game. Escape from the castle, and begin the flight from your captors. £9.95.

£9.95.

TI99-4A:

K-64: A game requiring patience and forethought, can you cover every square of a chessboard using the Knight & his legal moves? £6.50.

£6.50.

Alone at Sea: Your ship is sinking and you must escape, but you must find and carry provisions, and other items. £6.50.

£6.50.

SPECTRUM 48K:

Mystery Manor: Based on the game of Cluedo, this will really keep you on your toes to dodge the murderer. £6.50.

£6.50.

Master Code: Beat the computer in this challenging game of colour guessing.

£6.50.

ZX81:

Treasure Island: Cannibals and nasty birds are among the hazards in this neat program. £5.95.

£5.95.

Spelling Tutor: For all those who have trouble spelling, this program will be very useful. You can program it for any level of difficulty, and it includes a game as well.

£5.95.

NO NONSENSE GUARANTEE

For further details of these programs, or to order, please fill in the coupon below, or ring us on 085-982-313 or 239. Phone lines are open until 9 p.m. Dealer enquiries welcome.

All programs are in stock now, and are despatched within 48 hours of receipt.

All prices include VAT and P&P.

TEXAS TUTORIAL

Texas Instruments manages to combine fun and learning together in its educational programs. We look at its latest cartridge based software

In a funny sort of way, it has been sad to see that dowager duchess of the home computer scene, the Texas Instruments 99/4A, become involved in all the nasty skirmishing of the current price war out there on the High Street. Arguably the first computer to carry the moniker of 'home' machine, and still (arguably) one of the best engineered of that genre, it has had to get into battle with many a young 'upstart' machine, such as the Sinclair, Commodore and Dragon, to name but a few.

The battle, unfortunately, has been about price, and it is one that the dowager had implicitly lost. This had happened precisely because it was the first system, and the best engineered. It was born in an era when micros were still new, and minicomputers reigned. Texas was already known as a mini-maker, and so the 99/4A followed the same high-quality engineering path.

It was thus always an expensive machine, and this was its major drawback, for in trying to compete on price with the other machines, Texas had to cut its profit margins first to the bone, and then on down into the marrow. The company currently carries a noticeable loss on its home computer operation, and that is the big news about the system.

This is a shame in a way, for there are some features about the machine that make it one well worth investigating, especially if you are interested in using the machine for more than just fighting off the massed hordes of Alpha Centaurii (or is it Neasdon?).

The 99/4A has developed an enviable reputation for its educational software, and it is an area which Texas seems intent on exploiting. It may well seem a trifle altruistic of the company, and it does smack just a little of the paternalistic nature so often attributed to those from the southern states of the USA, but education is a BIG NUMBER with them, and they do it well.

The machine itself is, of course, ideally suited to the rigours of educational use. In this context, the users are predominantly young, and predominantly ham-fisted. To combat this, the 99/4A is the home computer industry's answer to the Sherman tank — it is tough, but also tolerant.

It was also one of the pioneers in the use of cartridge software. Now this is, arguably, not the most economic way of producing and selling programs. From the end user's point of view they are expensive (that word again) and this can often prove to be a greater disadvantage to the user than the format's inherent advantages — particularly its ease of use, robustness and safety. These are in practice, however, important features when letting small persons loose on high technology.

The software itself is also good, and the latest batch to come from the company takes the role of fun and game playing in education a bit further. Indeed, some of the new programs now combine some of the features of the classic computer arcade games with a reasonable degree of manual dexterity, and a goodly proportion of mental agility.

The company has introduced a total of eight new programs in the education area, and *Which*

Micro? has obtained some of them for perusal. It is interesting to compare them to earlier educational packages and, just to be fair, to the games programs that they mimic.

In the first case, they are a considerable enhancement, especially those to do with mental arithmetic. Instead of simply setting a problem and waiting for an answer, some of the new programs require the answers in a tight timescale. As games programs they are not so exciting as your average 'let's-nuke-a-galaxy' event, but there is considerable satisfaction in having beaten off the 'aliens' by being reasonable at mental arithmetic.

Take, for example, one of the new programs, *Alien Addition*. Here, the player is in command of a missile station being attacked by alien ships. Each ship has a sum written on its side, and the player has to move the station to under a selected ship, work out and enter the result of the sum, and then press the space bar to shoot. Entering the right answer

frees the station to fire a salvo at the attacking alien ship.

When the damn things keep coming at you, moving down the screen five at a time, it requires a mixture of both manual dexterity and mental gymnastics to win. It is also good training for thinking rapidly under pressure. Not only do you have to move the station to underneath one of the ships (achieved by using the left and right arrow keys), you also have to work out the sum and enter it before firing. Getting the sequence right is an effort of will in itself (certainly to begin with), doing sums at the same time gets surprisingly difficult.

Alien Addition is certainly for the older child, and indeed can give many grown-ups quite a surprise. I know for a fact that I am not the first adult to find himself initially humiliated by the game. The first time I saw this one, there were Texas executives not doing so well either.

As such, therefore, it is something of a race apart from the company's earlier offering,

THE QADS 32K RAM PACK FOR THE TI99/4A

The QADS 32K RAM expansion unit provides access to 8K of memory for machine code and an additional 24K of memory for Basic or other languages. This gives an incredible RAM + ROM capacity of about 110K with a module fitted in the front module port. The 32K RAM will fit any TI99/4a console via an obligatory QADS 2-port expansion/power supply unit which fits into the large side port on the right hand edge of the machine. It is very neat and the adaptor still retains access to the side port for the TI speech synthesizer or other TI add ons. Further, the 2-Port adaptor with 32K RAM fitted provides an extra slot for other QADS add ons.

Currently under development are RS232 and parallel printer interfaces, a disc controller and at the advanced planning stage we have a REAL WORLD INTERFACE which will link the computer to model traffic lights, motor controls and other laboratory or real world applications. The 2-Port adaptors can be linked together to provide 2, 4, or 6 slots plus the extended end port. The QADS 32K RAM Pack is fully addressable through TI Extended Basic and enables the CALL INIT, CALL LOAD, CALL PEAK etc. routines detailed in the Extended Basic Manual. It will load and run Assembly language programmes, and an increasing range of "FAST GRAPHICS" programmes are available to machines fitted with the RAM.

The TI LOGO and MINI MEMORY modules can be run with the RAM Pack providing superb education and development potential.

THE QADS 32K RAM PACK COSTS £199 + VAT INCLUDING ONE 2-PORT ADAPTOR AND POWER SUPPLY POSTAGE AND PACKING Total £228.85p

MAIL ORDER FOR THE TI99/4A

DEALER ENQUIRIES WELCOME

Number Magic. Aimed at the younger user, this provides what are essentially the same tests in mental arithmetic, but in a form where manual dexterity and speed of thought are not important.

Here, each sum is displayed individually, and the player gets time to work out the answer and key it in. None of the sums are too difficult and the program keeps a score to let the players know how well they have done.

On a general point, all the educational programs make extensive use of the 99/4A's colour graphics and sound generation capabilities, giving lavish 'praise' in the form of fanfares and suchlike when the right answers are entered. None of them are too nasty when mistakes are made.

This theme of combining arithmetic problems and the games approach is continued in some of the other games Texas

has introduced. **Dragon Mix**, for example, utilises the same basic approach as **Alien Addition**, in that sums have to be completed in order to win the game.

In this one, the Dragon is defending a city against an enemy equipped with tanks, or ships, or something. Anyway, on the side of the three somethings on the screen are the sums, and on the stomach of the Dragon is just one answer. So, what the player has to do is look at all three sums and work out which matches the answer on the tum.

Now, the Dragon has a long tongue which it points at each of the enemy in turn. The object therefore becomes one of waiting

until the tongue points to the right question and pressing the space bar. This will zap the enemy, which has been advancing on the city with a view to bombing it. (This is another example of how sums are important to the defence of life and liberty.)

Not all of the programs fit into this sums-'n'-games category. There are two that attempt to address the more general problems of numerology and try to cover the far more treacherous ground of providing a form for the concepts of numbers and mathematics. Not surprisingly, they are called **Numeration 1** and **Numeration 2**.

The objectives here include such elements as testing the player on the concepts of 'less than' and 'greater than', 'place value', and number rounding to an integer value. The two programs are aimed at different age groups, with No. 1 being intended for the five to seven year olds, and No. 2 for seven to nine year olds. This extends on the program developed in No. 1.

These did not seem to have quite the level of built-in interest and excitement that the other programs produced, partly because there was less of an element of competition and immediacy. Don't let this put you off, however, for numeracy is one of those things that all children should acquire one way or another, and the **Numeration** programs provide a more studious and leisurely environment in which it can be acquired.

The other programs forming

the latest batch of releases from Texas include **Alligator Mix**, in which hungry alligators eat apples that have correct answers written on them. The problems are written on the alligators' stomachs and the player has to get the alligator to eat the right answer to win. Then there is **Minus Mission**, in which a robot has to shoot blobs of slime. The player assists this process by working out the problems written on the blobs.

Having dealt with addition and subtraction, there are two more programs that cover the problems of multiplication and division. **Meteor Multiplication** has the inhabitants of a star station defending themselves against meteors containing multiplication problems, by firing a cannon that has the correct answers. **Demolition Division** has four tanks advancing, each with a division problem. The player has to stop their advance by finding the right answers to get the opportunity to shoot them.

A minor doubt that I do have about the programs, and one that does not detract from their immediate efficacy in putting over arithmetical education in an entertaining way, is the question of actually using the 'let's-nuke-this-city-for-starters' ethos of games programming. By making the educational elements an integral — and fundamental — part of the 'games', the programs follow a sensible approach of making education appear as something else.

I just wonder, however, about using this type of game with its predominantly violent approach as a means of education. It is unfortunate that violence seems today to be 'fun'.

Despite this personal quibble, the programs I tried seemed both inventive and, dammit, exciting. My ego suffered a few times, but then I never was much good at sums.

Another program I did enjoy, and one that can be fitted into the education framework, is **Music Maker**. This allows the user to write music (or should I say 'music') for three voices. The effect can be, well, interesting.

Two modes of writing are provided; traditional, and sound graph. The former is as the name implies. Each voice is written onto a one bar stave on the screen using notes ranging from a minim to a semi-quaver. There are also rests and accidentals provided, and the user can choose the key signature and time signature. Each or all of the voices can be played and edited, and the volume can also be set. This is a good way of learning the relationship between the written note and the sound, and quite complex pieces can be constructed by adding subsequent bars.

The sound graph mode is much less 'authoritarian' in approach, and much more fun for the non-musician. Essentially, this lets the user 'draw' a sound shape on the screen using three voices — each voice having a separate line shown on the graph. Speed, pitch, tone and volume can be selected and the effects can be both entertaining, and sometimes surprising. This, to me, is an excellent way of learning the relationship between written notation, the concept of pitch, and the sound that you hear.

As a final thought on the subject of the TI99/4A and its software, do bear in mind that there are some dowager duchesses around that can still show the flighty young things a thing or two.

RECRIMINATION.

by W. BARTON & B. LEHANE.

SPELLMIND

Joyce Tettmar's Spellmind is a rather nice Basic interpretation of the "Word Mastermind" genre of board games.

As it is printed here, it runs on the 16K Spectrum, but with the helpful documentation Joyce has provided, conversion to other home micros should present few problems for the average enthusiast. The key is in those detailed descriptions of how the program works — listing these also helps in the process of eliminating those annoying bugs which usually creep in when typing in a program listing.

One modification which will spring to the mind of all 48K Spectrum owners is the use of extra memory to increase the size of the word store. To make this possible, try the following changes:

(new line): 6010 LET W = INT(RND * the number of words in data) + 1

(new line): 8060 DIM W\$(the number of words in data,4)
8100 to 8350 — add/change words
8400 to 8440 — renumber if new DATA overlaps these lines

For those of you who want to expand or alter this program here is a rundown of how it operates.

Upon running, four subroutines are called, each of which performs a well-defined function. The first, at line 9000, simply sets up the user-defined graphics for the game by POKEing the bit-patterns into the relevant area of memory.

Joyce has chosen to represent the user-defined graphics by their character codes rather than by the more usual 'USR "A"' method. It could be argued that as the latter way would mean only one FOR..NEXT loop, it is the more efficient, but this isn't really at issue.

The next subroutine, at line 8000, prints the instructions for the game and reads all the data from lines 8100 to 8350 into the character array W\$.

As Joyce says, with a 48K Spectrum, this list of words could be expanded, which would also mean that you would have to increase the size of the FOR..NEXT loop on line 8070 and the DIM W\$ statement on line 8060 from 250 to however many words you decide to use.

The subroutine starting at line 7000 clears the screen and then draws the board by using the Spectrum's 'AT' function, and parameters for AT being the control variables of two more FOR..NEXT loops on lines 7020 and 7030.

Finally, the subroutine at line 6000 selects a random number between 1 and 250 and uses this to choose an element of the word array W\$. This word is put into L\$ and is the word that the player has to try to work out.

Note that throughout the program the readability of the code is high as Joyce has decided not to use multi-statement lines.

If, after assimilating the *modus operandi* of the program, you should decide to make it a little faster and a little more memory efficient, this can be done by combining a few of the separate lines into a rather more unreadable format — be careful of IF..THEN lines though, as if you combine these carelessly, you may find that the program no longer works!

Upon returning from these four subroutines, the loop counters for the number of goes (variable G) and the number of the letters in the word (variable R) are both initialised to 1.

Then, by using the rather more user-friendly 'INKEY\$' instead of 'INPUT' (which after all requires the player to press 'Enter' each time), the player's letter is obtained from the keyboard.

There is, however, two small problems here. First, as the player is given no opportunity within the 'INKEY\$' statement to delete his input, mistakes cannot be rectified.

Secondly, there seems to be a slight misunderstanding of the operation of 'INKEY\$'. By the use of the lines

```
190 IF INKEY$ = "" THEN GOTO 190
200 LET B$(R) = INKEY$
```

it is only because of the human's slowness that the structure works.

'INKEY\$' returns the character for the key being pressed as the function is called, so that in fact that value that INKEY\$ returns to break out of line 190 is only the same as the value put into B\$ because the player would have to have pretty fast reactions to change key in between lines 190 and 200. A more correct way of doing it would be as follows:

```
190 LET X$ = INKEY$ : IF X$ = "" THEN
    GOTO 190
200 LET B$(R) = X$
```

A minor quibble, but there are a couple of examples of it in the program and we wouldn't want to be accused of lying.

Lines 210 and 220 check to see that a valid character has been entered, and to change it to upper case if necessary by subtracting 32 from the code. A loop is then entered in which you are given ten attempts at getting the word, with corresponding calls to the subroutine at line 5000 to place the pegs on the board as required.

The comparison of guessed letter against actual letter is done a little inefficiently by converting the four letters of each word into their character code equivalents and storing these in two auxiliary arrays B and L.

You could easily alter this to make string comparisons.

All in all, a nicely structured program demonstrating a few interesting techniques, but with room for improvement by enthusiasts and perfectionists alike.

line 20 GOSUB 9000 — define graphics.

line 30 GOSUB 8000 — print introductory page and read store of words into string array.

line 40 GOSUB 7000 — board printed on screen.

line 50 GOSUB 6000 — computer chooses hidden word.

lines 60-250 — player inputs choice of letters. This routine loops round four times.

lines 260-360 — player may change mind before pegs are awarded.

lines 370-400 — arrays are created carrying codes of letters of hidden word and of player's current word.

lines 410-460 & GOSUB 5000 — black pegs are awarded. If a full house is scored program jumps to "WIN" routine.

lines 470-530 & GOSUB 5000 — white pegs are awarded or "NO" is printed if choice is completely wrong.

lines 540-550 — program loops back if player has had less than ten goes otherwise "LOSE" routine commences.

lines 2000-2090 — "LOSE" routine

lines 3000-3065 — "WIN" routine

MEMOTECH MTX SERIES

MTX500 £275 MTX512 £315

**Available in September—please phone for sales information
Memotech products are designed and made in Oxford and Witney**

The All-Purpose System

The MTX Series

The MTX Series is a new departure in micro-computer technology. Whether your needs as a user are for personal programming, games playing, scientific or process control, educational or business use the MTX Series is already capable or very easily adaptable to almost every application. Glance through the standard features below — you'll see what we mean.

Software

The MTX's 16k ROM contains several languages and routines which enable the novice or the experienced programmer to make full use of the machine. Standard languages are MTX BASIC, LOGO type commands, and NODDY. ROM routines include an ASSEMBLER/DISASSEMBLER with screen display of the Z80 CPU registers, memory and program, which can be manipulated from the keyboard. Machine code programs can be stepped through one instruction at a time, and easily called from within BASIC programs. A further feature is the Virtual Screen facility which enables the programmer to define sections of the screen to work independently whilst maintaining all full screen facilities. Pascal is available as an add-on ROM pack.

Hardware

The MTX500 has 32k of user RAM as standard (64k on the 512), expandable to 512k plus 16k of dedicated video RAM. Sixteen colours, 40 column text, 256 x 192 high resolution graphics with all sixteen colours available, and easily moveable user defined graphics (Sprites) combine to make effective screen displays quick and simple to achieve. Standard outputs are centronics

printer port, two joystick ports, an uncommitted I/O port, 2400 Baud Cassette port, separate TV and Video Monitor ports, 3 voice sound with hifi output plus a dedicated games cartridge port. Other standard features include the Z80A processor running at 4MHz, real time clock, full moving key keyboard with 79 keys including eight function keys and separate numeric pad.

The Disc Based System

The MTX series has been produced with performance and expandability uppermost in the design team's thoughts. When expanded to Disc level the computer supports the following facilities, which will be available in October:

- 80 column video board
- 5¼" floppy discs
- 5¼" hard discs
- CP/M 2.2, enabling the widely available range of CP/M based software
- Memotech Silicon discs — multiples of 256K of fast RAM expandable to 8m bytes
- Colour Wordstar
- A/D and D/A converters
- Networking

CONTINENTAL SOFTWARE

We're not just playing games...

BLOBBO

A fast maze chase with untold perils and hazards.

TOADO

Get the toad back to his nest – but don't get run over or drown on the way.

SUPER MINEFIELD

You may have seen other Minefield games but ours has tanks that lay invisible mines, and spiders that are *very* tricky to avoid.

CONTINENTAL INVADERS

Classic arcade action, with all the features that make this game so popular.

KILOPEDE

This one is very fast – its not easy to get past level two.

RADAR/SONAR

Eliminate submarines with a combination of radar screen and sonar, very realistic.

FLIGHT SIMULATOR

Take off, navigate and land your high powered light aircraft. All the features of true flight.

ALSO AVAILABLE:

RESCUE, BEAVER, CONTINENTAL RAIDERS, PILE UP, SIGNAL MAN and many more.

we mean business too.

MTXCALC

Sophisticated and powerful, the professional spreadsheet program.

MTX WORD PROCESSOR

All necessary features are included to give a powerful business tool.

ACCOUNTING PACKAGE

Sales and Purchase Ledgers, stock control, payroll – the complete business system.

PROJECT PLANNER

Speaks for itself, and helps you achieve deadlines efficiently and effectively.

STRATEGY BOARD GAMES

CHESS, BACKGAMMON, OTHELLO, DRAUGHTS.

EDUCATION PROGRAMS

MATHS 1 PHYSICS 1

The first two programs in a series of specially written software designed to teach at the pace and level best suited to the user.

Software for the
MTX
SERIES

Ah Diddums

Computer: Spectrum 16K or 48K
Price: £5.50

Supplier: Imagine Software, Masons Buildings, Exchange St East, Liverpool, Merseyside.

When people are bored by standard computer games and it is your occupation to produce and sell these games, it doesn't take you long to realise that you can't go on existing solely by churning out run-of-the-mill stuff, and quite soon originality becomes your key word.

Imagine, which seemed to have started off with this precept in mind anyway, presented two new games to us recently, both of which can certainly claim to be different.

However, whilst this difference is refreshing for we reviewers, it seems that Imagine is trying a new tack, confusion.

On receipt of *Ah Diddums*, I spent a week trying to work out how to play the thing as the instructions, although voluminous, are far from clear, and no matter how I tried, I could not achieve the object.

So, I phoned Mark Butler at Imagine, and finally figured it out — at least it was worth it.

You are a teddy bear (this is a standard chat-up line of mine!), and you have to go and comfort your young human owner who, as owners of teddy bears are wont to do (even Sebastian Flyte), is crying.

To cheer him up, you have to climb out of the toybox that you've been unceremoniously stuck in for the night, and in order to do this, you have to collect all the coloured bricks in the toybox and put them in order at the top of the box.

Simple, I thought, and so indeed it is (initially, anyway)

once you have discovered how to actually do this part correctly.

I thought, as indeed did everyone I know who has tried to play it, that this meant that you pick up a brick, and go and deposit it in the position of the same colour at the top. Having done this once, I found that all the brick positions took on arbitrary colours, and thus confusion reigned.

So, instead of doing that, I tried all sorts of things, all to no avail. In the end, I consulted my teddy bear, and he said "phone Jimmy Young, as I go around saying "this is what you do".

It's easy, really, but daft — you saunter up to the top of the screen with your brick, position yourself a little to the right of the place where the bricks are supposed to go, and drop the brick, whereupon it jumps into its proper place.

Now, I realise that all children expect their toys to be magical at night, but isn't this going over the top, just a little?

Anyway, you do this for all the bricks on the screen, avoiding the soldier on the left hand side, and collecting the little bits and pieces that don't qualify as projectiles (ie the things that disappear when you walk over them), and suddenly find yourself in the next box.

Ahah! a two-toybox family, you think. In fact, it's worse than that, as it appears that these boxes are actually infinite, but I'm probably wrong.

In each box, things get progressively harder, as eventually you get three soldiers, a train set, four mamma dolls resembling loopy cockroaches, two what I can only describe as 'things', and an aeroplane — all out to get you.

Quite an enjoyable game, with quite superb graphics, and a satisfactory antidote to invaders, et al.

Chateau

Computer: Dragon 32

Price: £7.95

Supplier: Gem Software, Unit D, The Maltings, Station Road, Sawbridgeworth, Herts.

"You are in an old chateau. When the old count who lived there died, he left all his worldly goods in the house. He also hid a hoard of treasure (valued at \$2 million)."

The opening might not be startlingly original, nor the adventure itself anything out of

the ordinary, but this new take from Gem does offer a certain amount of challenge and amusement.

You always begin in the same room, whose position is indicated in the top right of the screen: 1-3-6. This tells you the floor number, the X co-ordinate and the Y co-ordinate.

Although your start position is always constant, the movements you can make from that room and the objects you will find are different every time you set off, meaning there's always an element of luck no matter how much you learn through several playings.

All entries are single key, and the choices open to you are Move, Explore, Open, Status and Plan. These are really self-explanatory, movement being the usual compass directions, while Plan offers you a floor plan to show where you are and how you arrived there — would that there was a similar plan for life itself.

The first three floors our reviewer managed to investigate were all 6x6 in size, and while this sounds small not all the rooms are immediately accessible, and those that are contain pianos, fireplaces, clocks, statues, bookcases and other objects to be opened or explored or both.

The status display is disappointing in that it lists fully the various things you might find such as keys, lamps and clues, so that you know right from the beginning what items you are looking for. The status also has a note of the time lapsed, the treasure collected, and the strength units you hold, which start off at 100 but don't stay that way for long.

Strength is used up when you encounter one of a seemingly infinite number of monsters that populate the chateau: bats, salamanders, Golems and a few horrors more. Faced with one of these you have four options: Retreat, Fight, Gamble or Advice, the final one explaining the first three.

Retreating often works and so saves your strength, but not always; gambling puts your fate in the hands of the RND function and fighting needs some of your strength units to counter those of the appropriate nasty. Run out of strength and it's back to square one, or rather square 1-3-6. If you've amassed a little treasure, though, the computer will do a deal with you and allow you to buy some more strength, but at what can only be described as a Dragonian rate of exchange.

There are still several features our reviewer hasn't yet stumbled across, such as the mysterious travel agent who apparently turns up and whisks you off to exotic climes but the parts explored so far show it to be perfectly adequate. *Chateau* uses up all but about 3K of the Dragon's memory, and responds instantly to the commands, but being about 95 per cent text it does lose out when compared to software which offers you some graphics as well, such as *Pimania* or Winterson's *The Ring of Darkness*. Still, it should offer something to all but the hardened adventure freak, who will undoubtedly want more than the vintage offered by this chateau.

Jetpac

Computer: Spectrum 16K or 48K
Price: £5.50

Supplier: Ultimate Play the Game, The Green, Ashby de la Zouch, Leics.

With the now-apparent polarisation of games software houses into the good and the bad, it requires a great deal of skill and experience for a new company to get amongst the established big boys.

According to its press releases, Ultimate has just this skill — it is an ex-arcade game writer — but such claims are sure to engender great expectations.

A new idea, excellent implementation, extreme playability and addictiveness — *Jetpac* has all these, making all our preconceptions well-founded. Basically, capitalism is the name of the game; you have to visit an infinite number of planets, stealing the conveniently floating jewels, gold and treasure while collecting enough fuel to take your rocket to the next planet.

• SOFT RELEASE •

Every five planets, you have to assemble your rocket all over again, as well as doing everything else. Naturally, the planets' indigenous populations aren't too keen on you stealing all their valuables, and take steps to stop you.

Being a 16K program, there isn't much scope for variation, but even so, *Ultimate* has laudably created six or seven alien types, with various patterns of behaviour.

The first type always travel in straight lines and so are easy to avoid, but they get progressively more devious as the game is played, the final type being positively man-hunting, and it took us a long time to exactly understand their movement.

With *Jetpac*, as with any arcade game, a technique can eventually be discovered, but before that stage is reached it offers far more enjoyment and fun than the majority of games.

The graphics and sound are truly professional, taking the Spectrum very close to its limits, and the keyboard controls are sensibly placed and easy to master. There is also the option of using a Kempston joystick in place of the keyboard, which is a facility every game should offer, despite the highly personalised views of the use of these aids.

Definitely a 'five star' game in every respect. An excellent buy.

Zodiac

Computer: Oric 48K

Price: £10.39

Supplier: Oric Products International, Coworth Park Mansion, London Road, Sunninghill, Ascot, Berks SL5 7SE.

Zodiac, an adventure game, comes in possibly the most uninspiring packaging around. (It's the same as the 'Welcome to Oric' cassette.) It also comes with both slow and fast recordings.

We could not load either of the fast recordings so we tried the slow one. Success — it was loading! So, we sat back and waited and waited and waited. Some 20 minutes later the game started.

This long wait heightened our expectations of an excellent adventure, but on starting the message "Please wait a minute" appeared. This could only mean one thing. On typing ctrl-C our suspicions were confirmed — the program is written almost entirely in Basic.

It's amazing enough that people still write games in Basic

but to expect anyone to pay £10 for an adventure game that will have mediocre response times and allow the player to stop the program to examine both code and data whenever he/she gets into trouble is ridiculous.

The plot is quite straightforward; you have to collect six treasures and return them to the starting point.

The only difficulty arises when you try to get the sixth treasure, which is obtained by placing objects that represent the 12 astrological signs into a secret room.

The cassette inlay claims that the game "has lots of colour and sound" and indeed it has, if randomly changing ink and paper colours on entering each new location counts as colour. This, thankfully, can be switched off, unlike the sound, which is a horrible cacophony that is played on entering each location.

In the end, we deleted the code that produces the sound to make the game bearable. This also improved response times.

In conclusion, this is definitely over-priced at £10.39 but, for those of you who want to write adventure games, having the source code and data may provide some useful ideas.

Zzoom

Computer: Spectrum 48K

Price: £5.50

Supplier: Imagine Software, Masons Buildings, Exchange St East, Liverpool, Merseyside.

Having apparently come to the conclusion that its highly-stylised packaging has taken it above the run-of-the-mill companies, Imagine has decided to consolidate this position by maintaining the price at £5.50 but raising the standard of the packages so far that it leaves everyone else standing.

The new format consists of a very large box with 'Imagine' embossed upon it, that opens up to reveal the cassette and a well-printed instruction leaflet, surrounded by a 'marbly-spacey' high-gloss backing.

Of course, all this flash PR will come to nothing if Imagine's games follow its usual inconsistency of playability mould, but with *Zzoom* Imagine knows that it's not playing around; for once, this is the name of the game.

Your mission is to rescue innocent refugees from the genocidal enemy, whose sole intent seems to be bombing them to smithereens. Without you, everything is in the napalm of their hands!

Installed in your 'Ground Skimmer', you await each enemy attack wave, watching the indicator go from condition green through to red, and then the fun starts.

The first four waves consist of a mixture of bomber planes and 'remote piloted vehicles' (rpv); that is, guided missiles.

Just for once it is daytime, with clouds skimming across the scene, the red specks of the enemy gradually getting larger and larger as they get nearer.

At present, you only have machine guns as weapons, but with practice you don't get hit too often. The rpvs dive in horrifyingly realistic 3-D straight for you, and the bombers fire 'exotron' missiles resembling flying swastikas at you.

Your shields allow you to sustain some damage, but as each level is progressively more difficult, it doesn't pay to get hit too often. Another ever-present danger is bad flying, ie hitting the ground. This accounted for more lost ships than any mere rpv until the problem was overcome — then came the tanks.

Again, four waves of these, but the desert (love the palm trees) was teeming with divisions of the things. From now on, despite having missiles as an extra weapon, things get decidedly tricky, and subsequent stages were never reached. The package indicates that submarines and helicopters come into play from this point onwards, but we can't verify this.

A really excellent game, with the best graphics ever seen on the Spectrum. Yes, there are bad points, but they only amount to minor details. Here, though, is a list of the ones we found: poor sound usage; awkward to control when using the keyboard; the program crashes when the Kempston joystick option is selected.

The Black Hole

Computer: Spectrum 16K or 48K

Price: £5.50

Supplier: Quest Microsoftware, 119 The Promenade, Cheltenham, Glos.

The Black Hole uses a difficult key arrangement making it very hard to play, coupled with a rather less than inventive plot.

The scenario is this: in the middle of space, temporarily compressed into your television set, is a black hole which, unlike most other games involving this phenomenon, you do not have to try to avoid — your ship's computer does this for you.

Floating around the hole are numerous aliens on fast, if predictable, courses. Every so often, big jelly-fish type aliens come out of the black hole, and are worth more points, being rarer.

You have at your disposal three weapons — a neutron blaster, which fires in a straight but short line; a positive ion gun, which has a long range but whose path is dependent on your proximity to the black hole; and a negative ion gun, which simply bends in the opposite direction. It becomes easy to see why CND is a burgeoning movement!

In theory, you could just move around zapping the odd alien as you go, but because of the key arrangement, it is not quite so easy. This is the only challenge to the game — figuring out a way of co-ordinating your fingers to be able to use seven keys on the same row. Expletives abound, the mildest being the proposed banishment of the author to his own black hole.

It is said that very little is known about black holes, but Quest teach us one thing — there is nothing to know.

• SOFT RELEASE •

Backgammon

Computer: Dragon 32

Price: £8

Supplier: Microdeal, 14 Truro Road, St Austell, Cornwall PL25 5JE

The bad news for backgammon players is that it has taken almost a year for the first program to appear for the Dragon. The good news is that this first one has been produced by Microdeal, which has been giving the other software houses scarcely a look-in on the top ten lists.

But you do need to be a player already to make use of this, or at least be prepared to buy a book on the subject, as although the instructions for the program are comprehensive, there are no rules included for the game itself. This does seem to be rather penny-pinching, as versions for other machines find room for the rules on fold-out cassette inserts.

After a short burst of unusual organ-like music, making you feel you're in the inappropriate setting of a church, you are given several options to choose from: double speed, if your machine can handle it; instructions; light pen or keyboard; with or without sound; input dice throws yourself or let the Dragon do it; level of play (0-9); and finally whether you wish to play against a friend, the Dragon, or see the Dragon play against itself.

As can be seen, there are 10 levels of play, despite the cassette sleeve saying nine and the instructions saying six.

The board itself, in high-resolution, takes up most of the screen, and the counters and board are easily distinguished whether playing in colour or black and white. As there is only room on each point for up to five counters, you are also told the number of counters at the top of each point.

Moving is done by giving the number of the point you're starting from, followed by any key, then the number you're moving to, and Enter. A useful facility is the 'a' key, which will repeat your previous move.

The sound option seems at first to be a good thing, giving you a beep to confirm that a key has been pressed, which shows that the writer is aware of the Dragon keyboard problems.

However, I soon dispensed with the sound, preferring to clip a few seconds off the average response time. This seemed to be about 7 to 10 seconds on the lowest level, and between 20 and 30 seconds on the highest, though reaction is much quicker towards the end of the game when counters are simply bearing off, thank goodness.

The program does detect illegal moves automatically, and while it obviously offers most of the facilities you would want from a backgammon program, the most important question, of course, is the standard of play. This is slightly difficult to judge, depending as it does to some extent on the throw of the dice, but at the highest level it did provide a fair challenge to an average player over a series of games.

There was a tendency to make the occasional puzzling move, such as refusing to capture counters when this would have proved extremely awkward for the human challenger, and the prime consideration always seemed to be to move the furthest counters nearer home.

Our reviewer would have preferred a tougher opponent with slightly fewer facilities (why play against a friend on TV when you can use a proper board?), but having said that, the cassette is up to Microdeal's usual high standards and should prove a useful challenge to all but the best players.

View

Computer: BBC Micro

Price: £59.80

Supplier: Acornsoft, 4a Market Hill, Cambridge CB2 3NJ.

The first item on many people's software list is a word processor, and Acornsoft's *View* offers a lot of facilities one would expect of an advanced system. The program has automatic word-wrap, allows block moves, right justification and will search, change, replace or count words. There is full control of the page format and it is easy to correct,

delete or insert text.

View is supplied as a 16K plug-in ROM, which has the major advantages that it takes up none of the machine's valuable RAM space and you don't have to load the program to use it.

It is always in the computer and you merely type '*WORD' to see the Command Page come up on the screen. Plug-in ROMs will only work on BBC Micros fitted with operating system 1.0 or later, but a suitable upgrade will be supplied free when ordering *View*, if required.

The word processor works with any of the BBC machine's eight screen modes, although Mode 7 gives the best use of memory and holds roughly 4500 words, seen through a text window 36 characters wide. When using the 80 character per line display of Mode 3, the window expands to 76 characters but there is only room for about 1500 words.

The width of a block of text is governed by the 'ruler' above it — that is a line which is not printed but contains the tabs, left and right hand margins that the following text obeys.

It is a simple matter to alter the tab settings or the width of a ruler to format the text beneath it, either before or after the text has been entered. A new ruler may be inserted anywhere, and can be up to 132 characters wide.

View has been carefully integrated with the design of the BBC Micro, and makes full use of the cursor and function keys on the machine, although the 'copy' key has been disabled.

Most of the function keys are made to perform three actions by combination with the control and shift keys, and a guide to these is supplied with the program to slide under the clear cover on top of the computer. It certainly helps when trying to find your way around.

The 'escape' key acts as a toggle between the entry of text in Text Mode and the Command Mode, from which it is possible to control operations such as printing, filing and word count, search or replace.

Command Mode also displays the remaining memory, the file name, current screen mode and the number of markers set in the text. The 'star' commands, such as *FX and *MOTOR, can all be used in the Command Mode.

In the Text Mode, the function keys may be used to format, amend or correct the text file, and also enable 'Stored Commands' to be placed in the left-hand margin, which take

effect only when the document is being printed.

Stored Commands can define things like page layout, headings, printing of page numbers, and the centring of text. All the commands are described in the *View Guide* and *Into View* books, which accompany the ROM when purchased. They are well-written, and make it easier to get to grips with wp.

The *View* ROM is geared for use with disks, but works satisfactorily with a cassette filing system.

It is necessary to 'save' or 'write' a file on tape or disk in order to print it out, which makes the printing process very slow when cassettes are used.

Before printout, a file can be SCREENed (in 80 character mode if required) to show the final format with page numbers, headers etc. This command is useful, but it has not been carefully thought out, as no effort has been made to indicate the use of special control codes for the printer or, more importantly, the exact position of the edges or end of each page.

One snag with *View* is that it does not cope well with files as they get near to filling the machine's available memory. Rather than writing the file to disk automatically, or telling you to save the file and begin a new one, it becomes somewhat unpredictable in use, and has a tendency to suddenly 'beep' and destroy the line being worked on.

And as the system is fairly complicated to use, it would have been a good idea to include a 'Help' guide to each command — particularly as there is lots of space left in the ROM.

On the plus side, *View* will support continuous processing of sorts when using disks, such that an existing file can be edited and extended into a new one, using the command sequence: EDIT <old filename><new filename>; MORE: FINISH.

The theoretical limit for a file created in this fashion is half the capacity of the disk drive, but it is not possible to make back-ups when working in this manner — as I have just discovered to my cost while correcting this article. Any SEARCH or REPLACE operations would have to be used several times over to check the entire file for one mistake.

View also has a 'Macro' facility, whereby a block of text may be defined and printed anywhere in the text. Each macro has its own two letter code, and can incorporate a number of variables.

• SOFT RELEASE •

Standard letters can be printed after a fashion using this facility, although the system will not handle external data files, such as mailing lists. *View* can be used to edit Basic programs, although the manual gives no hint as to how to do this.

It is aggravating that adequate control of the printer can only be achieved when the Printer Drivers are bought for the extra £10, and there is at least one bug in the final ROM — checking the page layout using the SCREEN command sometimes leaves the machine in page mode. It can drive you mad if you begin to print, because you have to keep releasing the shift key.

All things considered, *View* does represent reasonable value for money at £59.80 and would be a useful addition to most collections of software for the BBC Micro.

It is likely to appeal to the more 'professional' user needing an 80 column display and advanced editing facilities, although it is not suited to the real business world. It has been designed to work best with disk drives.

The aim is to traverse this universe as guardian of a 'vital' convoy — ie the more left at the end, the more points scored. This convoy is endangered by anti-matter, but otherwise tame and somewhat predictable, aliens, which can be removed by laying anti-anti — ie real matter — gas clouds in their paths, and it eventually turns out that the only truly violent being in the universe is you.

One reason for your violence could be the not exactly ergonomic ship controls, all the keys initially being on the same row.

Initially, because upon reading the cassette inlay, you discover (almost too late in our case) that you can re-define the layout.

Good practice, but it still doesn't excuse what appears to be one of the author's more disagreeable traits — why start off daftly in the first place?

Possibly this seemingly minor quibble could be overlooked if the game were really original or exciting, but unfortunately it is not, mainly because of the sheer repetitiveness.

ZX Tool Kit

Computer: 16K or 48K

Spectrum

Price: Unknown

Supplier: Star Dreams, 17 Barn Close, Seaford, Sussex.

When you are developing a long program in Basic on the Spectrum, you will soon find yourself wishing that the Spectrum came with a few more utility functions, so common on the more expensive computers.

This toolkit cassette from Star Dreams offers just such facilities, together with block move, case change, hex dump, search and replace, REM kill, line merge, memory map, trace and variable dump.

Before describing more completely what each function does, it may be useful to explain how the program is used. There are two versions supplied, one for the 16K machine and one for the 48K machine, on opposite sides of the cassette.

Upon loading, the program deletes itself except for line zero, which contains all the facilities as defined functions. You then MERGE your own program, and everything is ready for use.

By simply issuing a 'RANDOMIZE FN x(v1..v2..)' command, the function is invoked, and being in machine code, it is fairly fast. In the example above, x is the particular

defined function you require, and v1, v2 are the parameters for that function. There can be between one and four of these parameters. Now to describe them....

Block move; this simply moves the block of lines specified by the first two parameters to the place indicated by the third parameter — at least in theory, as we could not get this one to work.

Case change; there are three options with this function; upper case to lower case, lower case to upper case, and upper to lower, lower to upper. This worked fine, but is there much use for it?

Block delete; as it says, no problems with this function, but be careful when using it. You may get the parameters wrong!

Hex dump; by specifying where you want to print the information (ie the screen or the printer) and from what address you want the dump to start, this does just that, and chucks out the contents of the memory in hexadecimal — not very useful for Basic programmers, and any serious machine code programmer has a good monitor for this sort of thing.

Search and replace; this type of facility is a feature of every good line editor, but in general they are a little more advanced than this, in that it is possible to selectively replace strings. Here, every occurrence of the search string is replaced by the new string. Nice, nevertheless.

REM kill; when you get to that happy stage when you are sure your program is finished, you may in your madness decide to get rid of all the helpful REM statements — unless memory is very short, this is not recommended.

Renumber; this is the second most useful function of the lot, and is better than most at doing it. You frequently see similar routines published in the magazines, but very few are able to successfully renumber the destinations in GOTO and GOSUB statements. This one can and does, which slows it down a bit, but it is still very useful.

Variables dump; without a doubt the best of the lot — this prints to your selected output device the entire contents of the variables area, in a very readable format, with line and statement numbers for FOR..NEXT loops.

If you find yourself in the habit of writing extensive and/or tortuous Basic programs, this is well worth getting, but the purists would no doubt say that an efficient programmer has no need for it. Oh, to be efficient!

Egg Farm

Computer: 16K or 48K

Spectrum

Price: £5.50

Supplier: Lasersound, Stratford Workshops, Burford Road, London E15.

A long time ago, Sinclair released the Spectrum, which despite its flaws is selling a hell of a lot. The lack of quality inherent in the first batch of software was at least partially excusable — Basic games were considered acceptable.

Fifteen or so months hence, there is really no justification for this still to be the case, and one would have thought that to release another version of an old game into an already overcrowded market was possibly a little foolish.

However, *Egg Farm* seems to suffer from both shortcomings in that not only is it a very thinly-disguised variation on the time-honoured *Pacman* theme, but it's also entirely in Basic. This limits the game in a number of respects: you get character (as opposed to Pixel) graphics, terribly slow reaction times and inefficient memory and therefore lack of facilities.

Quite possibly, these limitations could be overlooked if the game were able to offer anything new, but unfortunately with a myriad manifestations of *Pacman* already available to the Spectrum user, we find it very difficult to recommend this game.

To top it all, we had to break into the program in order to find out which keys to use, as nowhere are they indicated.

Without being unduly discriminatory, it appears that Lasersound is possibly a little naive at present — let's hope this isn't typical of them.

Violent Universe

Machine: Spectrum 16K or 48K

Price: £5.50

Supplier: Quest Microsoftware, 119 The Promenade, Cheltenham, Glos.

Whilst by no means winning the most poignant title of the year award, *Violent Universe* is at least a bit more adventurous than the many attempts that abound. However, the game itself fails to break the mould, and this universe's violence is rather more mundane than some of the hell-holes that the Spectrum has already taken us to.

- This is an entirely new computer system. It was designed with both eyes fixed firmly on the future. So that whatever shape the future takes, we'll be able to fit it into the system. Just as simply as the peripherals and software already available fit into the system. That way, the system will grow with you. And you'll never get left behind.

- Based around the Z80A microprocessor, and utilising Microsoft™ BASIC, Aquarius™ has 8K ROM and 4K RAM resident within its console. It is able to provide up to 16 colours and resolution of 320x192, and generates its sound directly through the television's speakers.

- With twin cartridge ports, the mini-expander allows simultaneous use of additional RAM and software cartridges. Twin disc game hand controls are included and the unit provides two additional sound channels. The 16K RAM cartridge plugs into either the console or the mini-expander, increasing Aquarius™'s RAM capacity to 20K.

- With the ability to reproduce the entire graphic and character set of Aquarius™ at 80 characters a second, the printer's 40 column output allows transcription of the complete monitor image.

- Using standard audio cassettes, the data recorder provides storage for programs and information, and allows the use of cassette based software. Incorporating a digital tape counter and transmission indicator, it operates sequential searching.

- A large number of games, designed to take advantage of Aquarius™'s sophisticated colour and sound capabilities, are available on cartridges that plug into the console either direct, or through the mini-expander. Cassette based games can be used via the data-recorder.

- A wide range of preprogrammed cartridges is available, including the LOGO teaching program and practical home data systems like FILEFORM™ and the spreadsheet calculator package, FINFORM™.

Talking Android Attack

Computer: Dragon 32 (+ 1 joystick)

Price: £8

Supplier: Microdeal, 14 Truro Road, St Austell, Cornwall PL25 5JE

"The first of a new generation of talking arcade games," say the ads for this recent *Berzerk* variant from Microdeal, though quite what the androids might have to say to those of us who spend hours trying to wipe them out is probably not repeatable.

In fact what the androids do say in this game is unrepeatable, but that's only because the sound is so metallic and forced that it's impossible to make out exactly what's being uttered. Again according to the ads, the statement at the start of the game is "Intruder alert," though on the version we tested it sounded more like "Issaythanger," a word which would tax even the panel of *Call My Bluff* for a definition.

The second phrase is clear and unmistakable: try and run away and you're called a coward. But the third phrase is another puzzler. Clear the screen and you should be regaled with "I'll get you next time," although it seems to us to be "You are in the next frame." We wouldn't stake money on it, though.

All of which is rather a pity as this does detract from what would otherwise be a fine machine code version of *Berzerk*, for one player only and needing a joystick, and with the familiar introductory options that Microdeal seems to be making standard for its arcade adaptations: background colour in black, buff or green; enter your name; level of difficulty from zero to 15. This

skill level affects the number of androids you face, and their ability to zip around and fire at you.

For those not familiar with the *Berzerk* scenario, you are trapped underground in a maze of rooms, each one containing several androids who are after you. In this version you are an animated matchstick man, and you can move and fire in eight directions, as well as being able to jump or duck if you can manoeuvre the joystick just right. There is also a crown in each room, which you collect for extra points, and you must be careful to avoid the radioactive walls. Brush against those and you sizzle like a sausage in a pan.

Simply shooting the androids once isn't enough to see them off, as they only turn into a mine, which you can neither shoot nor touch, and then after a while this hatches into a ghost android, which has the useful ability (for them if not for you) of being able to move or fire through walls.

The game also incorporates a count-down timer, with you scoring what's left on the clock if you kill everything in sight, swipe the crown and escape; and you have a protective suit, whose units are shown at the bottom centre of the screen. As long as you still have three or more of these you can sacrifice one in each room by jumping through a wall to create a doorway.

There is also an automatic difficulty adjustment, which reduces the number of androids you have to face if you're obviously having problems, but will increase their numbers and nippiness if you're getting a bit too big for your matchstick boots.

This is the usual arcade simulation from Microdeal, then, not quite as perfect as *The King* or *Katerpillar Attack*, but not far behind them. The movements in each room, and between rooms, is speedy, though don't go buying it just for the talking element or you might find yourself muttering a few words of your own in response.

Character Generator

Computer: Dragon 32

Price: £9.95

Supplier: Gem Software, Unit D, The Maltings, Station Road, Sawbridgeworth, Herts.

How pleasing to see a piece of software that allows you to create aliens rather than kill them.

You're not restricted to aliens, though; you can create whatever you can define in a 9×7 grid — or even several such grids side by side, if you find one too constricting.

The cassette comes complete with four pages of instructions, which are annoying in that they are just too large to squeeze into the cassette case itself, but they do explain very clearly how you can create a file of characters from scratch, or amend a file you've already created, each file being a possible 128 characters in length.

Potential uses that spring immediately to mind are a file of lower case characters, of foreign alphabets such as Greek or Russian, or of various scientific notations. As well as being able to choose between 128 different varieties of alien, of course.

The creation of a file requests you first to input the file name, and then to number each character as you design it. On the left of the screen is shown the large reference grid, with rows labelled A to I and columns 1 to 7. You type in the co-ordinates of each block you wish to fill in and when you are satisfied with the character this is transferred to memory prior to being saved. Invalid inputs are not accepted, and the response is very quick indeed.

Also on display is the character as it will appear in normal size, done on a 3×3 grid to show how a line or row of characters would shape up, thereby automatically reminding you to leave at least one row or column blank to allow for spacing. It would be helpful, though, if you could see the character on its own, too.

When satisfied with the file that you have created (and any character can be recalled at any time simply by typing in its number), type 'End' and then save the file as normal onto a data tape. A second program on *Character Generator* then shows you how to load a file into memory, and gives you a demonstration file of a sine curve to illustrate this, which also shows how characters can be used horizontally as well as vertically, if desired.

The slightly high price reflects the more limited market for a piece of software such as this, especially as more experienced programmers could probably design their own programs to perform these functions, but many readers would no doubt find it a useful tape as it effectively and speedily achieves what it sets out to do.

Metacraft Forth

Computer: Apple II

Price: £79

Supplier: Metacraft, 144 Crewe Road, Shavington, Crewe

Perhaps the greatest problem facing computer users is that of non-standardisation. Metacraft's product proves that Forth is not only different from other languages, it is also prone to variations itself.

The nearest thing to a standard for this particular language is the '79 Standard Required Word Set, and Metacraft has included most of this as a core. A Standard Extension Word Set handles strings and double precision arithmetic, and a Reference Word Set contains words left out of '79 Standard and some "candidates for standardisation" — words which are non-standard, at least for the time being.

Almost inevitably, the manual supplied is a reference work rather than a teaching guide, and as such it performs competently. Anyone wishing to start Forth programming would need to invest heavily in some more general texts on the language and its applications.

One potential stumbling block for many Apple II users is that Metacraft Forth does not support Apple's DOS 3.3, though the necessary interleaving routine can be patched in. The disk handling system included does most of its own housekeeping, updating blocks on disk as the user edits their screen equivalents in memory.

Editing is performed with a screen editor, probably the most accessible feature of Metacraft Forth. Although conventional Apple cursor control (using the ESCAPE key) is not supported, the extra arrow keys of the Apple IIe are compatible.

Getting used to not having the ESCAPE functions can lead to some accidents at first, as the editor uses ESCAPE to cycle overwrite, insert and delete modes: once mastered, however, input and editing are up to word processing standards.

Forth on the Apple is likely to remain the province of specialists. That said, Metacraft Forth runs smoothly and offers an up-to-date vocabulary, including most contemporary Forth improvements and a number of original contributions.

• SOFT RELEASE •

Homac

Computer: 48K ZX Spectrum
Price: £8.95

Supplier: David Martin Associates, 71A Princes Road, Richmond, Surrey.

There comes a time when even the arcade-crazed staff of *Which Micro?* get bored of playing games and settle down to using computers for real applications. However, with Homac, two objections immediately come to mind — first, what Monty Python says about chartered accountancy may well not be the joke it appears to be, and second, is it really viable on a Spectrum?

If you should decide that these conclusions do not hold and you want a program to handle all your home finance, then with a very extensive (not to say formidable) program and equally large manual, Homac at least provides the facilities.

Having acquired the package (on the assumption that you are prepared to commit your financial data to cassette — a prerequisite here), you are then unfortunately faced with the huge job of deciphering the manual. To coin a computer cliché, it is not user-friendly, and this is reflected in the product itself — it seems to have been written with the author in mind rather than the user.

Therefore, you either have to re-read the manual a few times, or try using the program a little more than should be necessary in order to get to grips with it. With one hundred different accounts for a veritable multitude of financial sins, clarification comes a long way after confusion.

On initial release, Homac was written entirely in Basic, and even with the new machine-code additions, certain functions can, on the manual's own admission, take up to an hour to conclude. These delays, combined with the inconvenience of loading from cassette, may deter serious use.

So if your home accounts are of such a complexity that you feel you require such a comprehensive system, and you are prepared to put in the effort and time to make use of the program, then certainly Homac would fulfil that need. In general, the average Spectrum owner would probably find this product redundant. If finances were this complex, a human accountant would be needed anyway.

Heathrow Air Traffic Control

Computer: Any Spectrum
Price: £7.95

Supplier: Hewson Consultants, 60A St Mary's Street, Wallingford, Oxfordshire.

It must be said that this is not a standard simulator — in fact, it is not meant to be. It is more a tutor on the subtleties of reality in that it is as near as possible a small-scale emulation of Heathrow's control area. How on earth they managed to get half the London Borough of Hillingdon and substantial proportions of Surrey, Buckinghamshire and Berkshire into 16K we may never know!

Although the cassette cover is by no means startling, there is more information contained therein than is found in most companies' entire product range — a full 11 sides of densely packed text that is initially rather daunting, but is essential reading if one wants to appreciate this product.

Having spent an entire afternoon taking all this stuff in, you are finally prepared to load the cassette and 'play' the 'game'. The inverted commas are not derogatory, they merely indicate that this product is not a game which is played, it is a program that is run.

Apart from reading the text, it is vital that on first running you use the demonstration facility, and closely watch what is going on. If flight simulation, control or just aeroplanes in general interest you, then you can expect some highly absorbing (but very anti-social!) and extremely challenging times with this very well implemented program.

Wordwise

Computer: BBC Micro
Price: £45

Supplier: Computer Concepts, 16 Wayside, Chipperfield, Herts WD4 9JJ.

The design of the *Wordwise* word processor comes as an 8K EPROM for the BBC Micro. It needs a 1.0 operating system (or greater) to run, and once plugged into a spare ROM socket inside the machine it will normally remain dormant until *WORDWISE or *W. is typed. The chip is then activated and the menu will appear on the screen.

The extreme right-hand socket in the micro should be occupied by the Basic ROM, but placing *Wordwise* there will cause the word processor to run whenever the machine is switched on, as the BBC Micro defaults to the right-hand language ROM on power-up.

Being menu-driven, options such as loading, saving, printing or previewing text are quite straightforward on *Wordwise*, and the normal operating system calls such as *FX and *MOTOR still function in the menu mode. The 'escape' key switches between the menu and 'edit mode' (for text entry), which uses the teletext display and hence is easily read on most monitors and television sets.

A status line at the top of the screen shows a word count, the amount of memory free and whether 'insert' or 'over-write' has been chosen with one of the function keys used for text corrections.

An aid to editing is that text is entered or amended in the centre of the screen, and is always seen in the context of a fixed amount of material either side. The text is moved about this 'centre line' using combinations of the cursor, shift and control keys.

Pressing CTRL «up» or CTRL «down» is particularly useful at the editing stage, displaying one pageful of text at a time.

Embedded commands may be inserted anywhere to govern the format of the document at the printing stage. These commands are differentiated by appearing on the screen in green, or dark grey on a black and white set. As on any word processor they are quite complex, and take some getting used to, but the system defaults to an 'average' set of values for page lengths, justification, top, bottom and left hand margins, which would enable the most inexperienced operator to

achieve some sort of printout.

Fortunately, the commands have been carefully named to make them easy to remember. For example, 'JO' means Justification On and 'PLn' will set Page Length to 'n' lines.

Special printer features such as double-width printing and underlining can be obtained anywhere within the text by following the 'OC' command with the necessary printer control codes. It is possible to preview the layout of the text held in memory using the 80 character per line mode of the BBC machine, but this display takes up 16K of RAM and if there is insufficient room the preview will switch to the teletext mode.

There are two nice touches in *Wordwise*. The first is that the 'shifted' function keys can be pre-programmed with commonly used strings of commands or text to save time during text entry and formatting.

Additionally, it has the ability to read Basic programs which have been *SPOOLED as ASCII files from the machine onto tape or disk. In this form the programs may be edited remarkably easily, using facilities like insert and search and replace to knock them into shape at speed.

The drawbacks of the system are that it will not tie in with external data files for standard letters and it will only handle files as long as the machine's memory, or about 4500 words. There is no facility to print multiples of a document, or to draw from several 'chapters' in one printing run.

It is very difficult to create tables using *Wordwise* because of its 40 character display, but owners of another Computer Concepts ROM, the 'Beebcalc' spreadsheet, will find that they can create tables on that system and incorporate the files in *Wordwise*.

On the plus side, this word processor will print direct from memory, which is a bonus for users running cassettes. Computer Concepts is able to offer the operating systems necessary to run *Wordwise* on BBC Micros without '1.2' for a nominal charge.

While *Wordwise* lacks some of the features necessary for 'professional' word processing, it does offer some nice facilities and is perfect for the hobbyist who needs to edit Basic programs as well as entering and amending normal text without too much effort. And at around £45, *Wordwise* is certainly good value for money.

STOP PRESS

A brief round-up of those software products which landed on the *Which Micro?* desk just too late for a full review

Vic 20

Fantazia

What would you do if you were invaded by beings from the planet Interceptor? Zap!! them of course, while they fly in formation and bombard you with lazer pods. For the unexpanded Vic 20, written in machine code.

Price £6.00

Interceptor Software, London House, The Green, Tadley, Hampshire

ZX81 16K

Cosmic Guerilla

Sounds quite exciting, this one. It's got aliens with no feelings, Svlegian (I had problems saying it too) Raiders and even a Space Farers Anthem. The usual adventure.

Price: £3.95

Quicksilver, 13 Palmerston Road, Southampton SO1 1LL

U.F.O.

You have to blast Kamikaze aliens out of the sky and avoid

=Protek= U.F.O.

a neutron bomber at the same time.

Price: Unobtainable

Protek Computing, Clydesdale Bank Building, High Street, South Queensferry, Edinburgh EH30 9HW

Spectrum 16K or 48K

Froggy

Froggy wants to go home, but it's not that simple. There's a busy main road to cross, a river to negotiate with logs and turtles for stepping-stones.

Hazards such as alligators and snakes appear as you increase your speed with each game.

Price: £5.95

DJL Software, 9 Tweed Close, Swindon, Wilts

COSMIC GUERRILLA

Cosmic Guerilla

Struggle to protect Earth's dwindling supply of ion laser cannons at all costs against waves of rampant alien attackers. Mind they don't wipe out your vital force field, though.

Price: £5.50

Crystal Computing, 2 Ashton Way, East Herrington, Sunderland SR3 3RX

Jumping Jack

At last, something different. Jumping Jack knows something you don't — a four verse limerick. He'll recite it to you if you help him jump the levels to the top of the screen. There are 20 screens to go before you learn the whole rhyme, each completed screen is worth two lines. Happy reciting...

Price: £5.50

Imagine Software, Mason Buildings, Exchange Street East, Liverpool L2 3PN

Learn To Play Guitar

This program takes the learner through all the elementary

LEARN TO PLAY GUITAR

stages of guitar playing using graphic display and sound.

Price: £6.00

Lasersound, Stratford Workshops, Burford Road, London E15

Roadrunner

Arcade-type game where you have to drive a hot-rod car round a course while trying to avoid various hazards.

Price: Unobtainable

Protek Computing, Clydesdale Bank Building, High Street, South Queensferry, Edinburgh EH30 9HW

Spectrum 48K

From Russia With Luck

This one should keep you amused for a while. You are lost in Europe in possession of secret documents which the KGB (no less) would like. If you don't reach London then the whole Earth is in trouble, but never mind, if all is lost, then you can always take your suicide pill. This game uses genuine European travel timetables (honest).

Price: £9.95

Jabberwocky Software, 610 Washwood Heath Road, Birmingham B8 2HG

Spectrapede

The creepy-crawlies are revolting! Defend your mushroom patch against scorpions, worms and other assorted nasties.

Price: Unobtainable
Protek Computing, Clydesdale Bank Building, High Street, South Queensferry, Edinburgh EH30 9HW

Go To Jail

Monopoly-type game with a difference — your Spectrum can play too. Features an automatic honest banker though in my experience it's more fun if the banker's dishonest.

Price: Unobtainable
Automata UK Ltd, 65 Osborne Road, Portsmouth, Hants PO5 3LR

Hummer House Of Horror

You have to rescue a young maiden from the dear old Count's clutches. She's trapped in a room in an old house and you've got four floors of rooms, creatures and objects to contend with. Oh, and one hour to do it in.

Price: £7.00
Lasersound, Stratford Workshops, Burford Road, London E15

BBC B

Number Gulp

(for ages 5-12)
Children can practise number skills — addition, subtraction, multiplication and division — in an interactive game by building numbers using only those displayed on the screen. 19 levels.

Number Puzzler

(for ages 4-12)
Four games to improve mental arithmetic ability.

Facemaker

(for ages 5-12)
Face-building step by step.

Hide & Seek

(for ages 5-12)
Three games, *Hide It*, *Seek It* and *What's Missing?* to develop short term memory for learning to read.

Let's Count

(for ages 3 upwards)
This is a program which introduces children to simple counting using the numbers up to nine.
Price: £9.95 each
Applied Systems Knowledge, London House, 68 Upper Richmond Road, London SW15 2RP

Atari 400/800/1200

Orc Attack

(Cartridge)
The horrible Orcs have the castle under seige but they're bored now and want to play really nasty war games. Of course, you can kill them by hacking their heads off, but your best and final weapon is the boiling oil which will tide you over until the evil Sorcerer appears to spoil the whole thing for you.
Price: Unobtainable

Atari International (UK) Inc,
185-195 Ealing Road, Alperton,
Wembley, Middlesex.

River Rescue

(Cartridge)
Rescue some explorers lost in a wild jungle by navigating a dangerous river. You have to avoid or shoot obstacles in this river — which could be extremely messy if they turn out to be mines laid by your rivals.
Price: Unobtainable
Atari International (UK) Inc,
185-195 Ealing Road, Alperton,
Wembley, Middlesex

Dragon 32

Franklin's Tomb

Your name is Diamond. Dan Diamond. You must explore the crypt and unlock the puzzle. Adventure game requiring the use of lateral thinking and magic words, comes with 18-page booklet containing witty black and white illustrations.
Price: Unobtainable
Salamander Software, 17 Norfolk Road, Brighton, East Sussex BN1 3AA

Before continuing last month's round-up of Dragon books, it's worth remembering one of the many Iron Laws of Computing, which people usually discover very quickly for themselves: the quality of a product is in inverse proportion to the claims made by those trying to persuade you to buy it.

I was reminded of the truth of this while looking through the titles now available to Dragon users, and though this month's concluding batch of books is generally worth having if your finances can stretch to it, one of the poorer efforts is described on the jacket as "Another great book," offering "thirty magnificent games."

Among these wondrous offerings are such earth-shattering examples as Hangman, Hunt the Wumpus, Battleships, Pontoon, and two versions of Lunar Lander: Venus Probe and Martian Module. There's a minimum of explanation, and not a lot of high resolution graphics either, so the title I wouldn't rush out and buy is *Dynamic Games for your Dragon 32* by Young, Bush and Shrimpton (Interface Publications, 180 pp, £4.95).

To show that there's no bias against the publisher, Interface has also brought out one of the best books around; *Making the Most of your Dragon 32* by Clive Gifford (296 pp, £5.95). This gives much of the information the manual should have provided but didn't, or didn't explain clearly enough. Clive Gifford's text certainly has clarity, and the book's only real shortcoming is the inexplicable lack of an index, with not even the contents being page referenced. This is a great pity as it is the kind of book you could otherwise turn to if you wanted to check how particular functions worked. The sections on Peek and Poke and mastering graphics are especially useful.

Most publishers seem compelled to offer you not one but two titles, and among these is

DRAGON TALES

Mike Gerrard winds up his look at the best of this year's crop of Dragon books

Shiva Publishing, whose Friendly Micro series includes *Easy Programming for the Dragon 32* (122pp, £5.95) and *Further Programming for the Dragon 32* (106pp, £5.95), both by Ian Stewart and Robin Jones. I liked these two books, which have a relaxed but informative style, constantly setting the reader small projects to do to ensure that the information is going in. This teaching technique has been around for a few thousand years, so I wonder why most books that are attempting to teach you programming ignore it?

Easy Programming is aimed at the beginner rather than the expert, and takes the view that the most important thing is simply to get the program to work. The second title then aims to improve your technique, so that the programs not only work but do so economically and logically. The only drawback to the two books is the cost. Comparing size, price and content, the Clive Gifford book effectively offers you two for the price of one.

This is far better than offering you precious little for the price of one, which I'm afraid is what *Learning to Use the Dragon 32 Computer* by George Knight does. This is one of a series from Gower Publishing, and costs £4.95 for its 112 pages, many of which are either blank or contain endless repetitions of what has already been said.

Although the book is aimed deliberately at the young and inexperienced reader, there is still an excess of padding: a half-page photo of a cassette tape, in case you don't know what one is like, an exciting photo of what the screen looks like while the machine is searching for a program, and two equally exciting identical photos in different places of the left-hand side of the Dragon. I suppose if you are an absolute beginner and totally

baffled by the computer then the book might be worth trying to get through the library, as one read should be more than enough.

Granada's impressive list of computer titles is increasing at the speed of light, and it can now tempt Dragon owners with three books. Least tempting is *The Dragon 32 Book of Games* by James, Gee and Ewbank, which will set you back £5.95 for its 132 pages of "21 Top Quality Games". This is another book that is not exactly over-modest about its own contents, with a liberal sprinkling of words such as "compulsive" and "impressive", though how anyone can describe a computerised sheep-dog trial as "extremely realistic", I don't know. Some of the games are different and good, but the familiar names are all here: invaders, dice, squash, tennis, noughts and crosses, and so on.

Preferable is *The Dragon 32 and How to Make the Most of It* by Ian Sinclair (158pp, £5.95), which, like the Clive Gifford title, explains in much greater detail many aspects of the machine incompletely covered by the manual, such as use of colour and string handling.

Granada's third title — and there are more on the way — is *The Dragon Programmer* by S. M. Gee (160pp, £5.95). The first 20 of those pages are yet another explanation of how to take the machine out of the box and plug it in, which could be regarded as very basic programming techniques indeed, I suppose, though more suited to a chapter on debugging: "Your program doesn't work? First check that you didn't leave your Dragon on the bus coming home". But when the author does get going on programming, he teaches it slowly and steadily, and the book is more a course in Basic with special reference to the Dragon. A useful one to have.

Some titles fail because they try

to cover everything, so you get half a dozen books competing for the same market.

More successful are those that stick to one topic and cover it in greater depth, which is what Keith and Steven Brain do in *Dragon 32: Games Master* (Sunshine Publications, 200pp, £5.95). If you can't write a half-way decent game after reading this then it will be down to your own lack of imagination, not any fault of the authors, who, because they are covering a limited topic, have the elbow-room to spend whole chapters on one technique, such as scrolling or constructing a simple maze. They also believe in making the reader do regular homework at the end of each chapter, and for that and other reasons I would recommend the Brains' book as the best of this month's selection.

As we all know, space is the final frontier, and as the editor only allows us so much of it every month there isn't room for a run-down on the many Tandy books that Dragonites could delve into, so don't forget to look round your nearest Tandy shop as well, if you haven't already.

If you're dying to get into assembly language, there's a book called *6809 Assembly Language Programming* by Lance A. Leventhal, published by Osborne/McGraw-Hill in the States but available here at a massive £12.95 for a heavy tome. I can't tell you exactly how big it is, as the pages aren't numbered, but if it does nothing for your programming it'll at least develop your biceps. Then if you get fed up with it you could always try tearing it in half.

A quick calculation with pen and paper (you remember those, don't you?) shows that if you bought all the books I've reviewed in the last two months it would set you back £102.70. Are there any bets on when the cost of the books going up will meet the cost of the Dragon coming down?

SUBMARINE HUNT

A simple but amusing game from the Garveys of Osterley in Middlesex, Submarine Hunt is reminiscent of those 'Battleships' games which people played before the invention of the personal computer.

Using your three remaining depth charges, you must track

down and destroy an enemy submarine. The cove in which the sub is trapped is divided into a grid, and you enter the co-ordinates of the square you wish to attack.

Added interest is provided by the sound effects. Full instructions are included in the program.

**Microcomputers?
Let Rank Xerox
point you in
the right direction.**

If you're confused about which microcomputer system is *exactly* right for your office, let Rank Xerox be your guide.

Today, with so many systems available, it makes sense to deal with just *one* company who can supply all your microcomputing needs – the hardware, and specifically tailored software.

The advantage: total compatibility. There's no shopping around for compatible equipment (printers, disc drives, etc.); just look for the Xerox name. You'll find it on every item you require to quickly establish a cost-effective microcomputer system.

Also, Rank Xerox offer you the "Helpline" service. As its name suggests, we don't just provide you with the right microcomputer system for your business, we also help you through those first vital stages of operation. Any questions, just call us and our specialists will work with you on a telephone link. No charge.

On-site servicing is another benefit of choosing Rank Xerox. And it's prompt.

Powerful microcomputers designed to help you manage your business better

Not just power, but simplicity, too. And compactness. Keyboards and controls have been more thoughtfully designed to make working with Xerox microcomputers easier and more comfortable.

The new Xerox 820 II range, for example, has all the built-in memory and

operating power you could possibly need. It's CP/M* based with 8-bit or 16-bit versions. You could select the advanced 820 II HRG, with on-screen graphics for plans, graphs and so on.

For extremely powerful word processing and microcomputing together in one complete system, there's the Xerox 823.

And remember, these are *expandable* systems that grow as your business needs grow. At the same time, they're *adaptable* systems, with many disc drive and printer options to suit your requirements.

Software for every aspect of your more efficient business.

Every aspect of your business can be controlled more efficiently by you and your better designed Xerox microcomputer.

Budgetary and financial analysis, records and data management, word processing, plus specific business accounting packages that help you to calculate payroll, update sales ledgers, and monitor stock control, and more.

Suddenly, you could have instant access to all the information you need to make informed business decisions – information you can update, manipulate, and store on easy-to-file discs.

You're able to work in your choice of computer languages too, including BASIC, Pascal, Cobol and APL.

Which Xerox microcomputer system is right for you? Let us point you in the right direction right now. To the coupon below. Simply fill in and freepost it today.

Alternatively call our 24-hour enquiry service. Dial the operator and ask for Freefone 2279.

JABBERWOCKY

WANTED — MACHINE CODE PROGRAMS — EXCELLENT ROYALTIES PAID

Way back in June, after the heady success of the Pet Show, there were a lot of new Commodore products heralded as being just around the corner.

The Show was successful in terms of numbers of people through the door, numbers of new products that Commodore managed to get almost ready for the Commodore 64, and the numbers of 700-series machines that were on display running a wide variety of software.

So successful as a company public relations exercise was it that, just one week after the extravaganza was over, we received a press release regarding next year's Show, saying that (apart from being at the same venue) the Show for 1984 would run from the 4th to the 11th June.

You don't need a Vic 20 to work out that that means an eight day Show, running from Monday to Friday.

One could cynically argue that the new products announced for 1983 might actually be on sale on the last day of that Show. Certainly there's no sign of any of them appearing in the shops yet.

If you went to the Show you'll certainly remember that amazing football game for the Commodore 64, a two-player game featuring crowd noises, two complete teams and a Bruce Grobelaar impersonating goalkeeper. It lacked the toilet rolls and hooliganism, the tackles from behind and players being sent off, but football could do without all that anyway.

It was also being offered by one unscrupulous Commodore employee on disk, to anyone who would care to buy him/her a rather large supply of alcohol. Being offered typical *Which Micro?* column rates I had to turn that offer down, but it seems that the only way to get your hands on a copy of the program today would be to get in touch with that

Pete Gerrard reflects on the importance of public relations, user groups and US mags

self-same employee.

There were many other games for the 64 there as well, but they too are noticeable in the shops only by their absence. When will Commodore learn that, if you announce a product you've also got to release it!

One Commodore employee was heard to say to one poor buyer that the 500 series would be on sale again in the summer. Whatever else he said, he neglected to report that he wouldn't be on sale in the UK. Or anywhere else, for that matter.

More Exhibition News

Also on display at the Show was Jeff Minter, the name behind the amazing Llamasoft. He writes great games, just about everything produced by Llamasoft is a gem, but...oh dear! If he ever appoints a PR company it'll have its work cut out.

Interceptor Micros suffers from the same fate at the hands of its diminutive star writer:

These new companies, products of a microcomputer age that has made them very rich very quickly, will have to learn just as much as Commodore will that it takes more than great software (or great hardware) to keep a company going. You need image too, my friends.

Since the Show, there has been nothing too new on the Commodore front from the company itself. New employees come and go, most of whom seem to have had most of their computer experience selling milk, or marketing porno magazines — OK, I admit I made that one up! — or other jobs which have little or no relevance to the computer world.

Outside Commodore, however, many things are happening, you'll hopefully be pleased to know.

For instance, price cuts by the major stores continue to bring the cost of Vics and 64s down to ever more affordable levels, although there's plenty of margin yet for more cuts.

If, as seems to be true, the Vic 20 costs more to make than the Commodore 64, why is there still a vast price differential between the two? Commodore has the opportunity to wipe out all the opposition, but it just doesn't seem to be taking it.

Still, if you live in London you can always go along to Morgans Camera Store in Tottenham Court Road and pick up a nice, cheap second hand machine. See July's *Which Micro?* for more details.

New Bookware

Well, you've got to call it something. There's software and hardware, so why not bookware?

Whether you buy a machine at full price or not, you will presumably be wanting further information about your new computer sooner or later, so let's take a look at some of the American magazines that produce Commodore dedicated material.

Of these magazines, Commodore's own *Power/Play* (the games one) and *Commodore: The MicroComputer Magazine* (the more serious one) are getting better, but not yet worth the effort of seeking them out.

However, if you want to know what our transatlantic cousins are up to, writing to Commodore UK (Vicsoft, 675 Ajax Avenue,

Trading Estate, Slough, Berkshire) should elicit a response.

On the more general side, *Compute!* continues to be the main American source of Commodore related useful information, with every issue containing many articles of use to owners of all Commodore machines, even back to the original small keyboard Pets.

It also covers a number of other 6502 based micros, Atari and Apple amongst them, but its long-standing connection with Commodore should ensure a healthy supply of Pet/Vic/64 related articles for a long time yet. You're not likely to see this one in the nearest shop, but your newsagent can probably get you a copy if you ask him nicely.

Byte, the monthly encyclopaedia that Daley Thompson probably uses for weight training, usually contains some articles of Commodore interest, but with this one you are well recommended to find a shop that sells it and just buy certain issues.

Each issue deals with a specific subject in the world of micros, be it robots, adventure games, financial forecasting or whatever, so just choose the one you want.

The Transactor from Canada is a very fragmentary publication, but when it does appear it always has something of note. Try Commodore UK again on this one.

The Torpet, also from Canada, is very expensive for what it is, but you do get access to its vast library of (almost) free software. It can be reached at Horning's Mills, Ontario, Canada LON 1JO. If you fancy using your boss's 'phone, it's on (519) 925-5376.

User Groups

User Groups continue to produce their offerings, some of these being very good indeed. I would heartily recommend anyone to join their local user group.

Details can usually be found in your local library or town hall, but if not then the overall figurehead is one Wing Commander Ryan (aka Mick), who lives at Riverhead, 164 Chesterfield Drive, Sevenoaks, Kent.

Drop him a line (don't ring, he's a very busy man: that's why there's no telephone number!), and as well as a courteous and speedy reply you will also get details of your nearest user group.

Subscription to a user group usually entitles you to a monthly (or bi-monthly) magazine, as well as access to a very large library of programs. Well worth joining.

All right! Let's see it work this out, then.

HISOFT PASCAL DEV PAC

Quality ZX SPECTRUM* Software

Hisoft Pascal 4T and Hisoft DEV PAC turn the SPECTRUM into a powerful machine - ideal for those who wish to produce quality software, be it business, educational or games software. Hisoft Pascal is also available on other machines - see below.

Hisoft Pascal produces programs that run up to 100, and in some cases 1000!, times faster than the equivalent programs written in ZX BASIC. This Pascal compiler is a virtually complete implementation of Standard Pascal (Jensen/Wirth), comes complete with a 60-page manual and represents tremendous value for money.

Hisoft DEV PAC comprises a powerful assembler and a disassembler/debugger which open up the secrets of fast machine code programming on the SPECTRUM. DEV PAC contains a unique blend of advanced features that you will not find together in any other product. These include conditional assembly, front panel display of registers, single step of programs (Even in ROM) and much, much more. 'DEV PAC is most highly recommended' - Your Computer, May 1983.

STOP PRESS Pascal now supplied with free LOGO. Turtle Graphics.

PRICES: SPECTRUM: PASCAL 4T - £25 inclusive. DEV PAC - £12-50 inclusive.

PASCAL 4T for the SHARP MZ80A/K/B, NASCOM, NEWBRAIN - £35 plus VAT.

GHOST'S REVENGE

by Dominic Wood

The best maze-chaser game available for the Spectrum *Super-fast machine code action *Excellent graphics *Full use of colour *Sound effects and tunes *Normal or Invisible maze *Skill level selector, novice to expert; this game cannot be beaten *Usual features, gobble action, four ghosts, power pods that turn the ghosts blue, blue ghosts give 400, 800, 1200, 1600 bonus points. Top score, for Spectrum 16k or 48k.

ONLY £5.95

NEW!

CYBOTRON

by Dominic Wood

New from Micromania, this has to be one of the best arcade type games available for the Spectrum. Blast away the attacking robots before they get you *Super-fast 100% machine code action *Excellent, smooth full colour graphics *Explosive sound effects *Four different types of robots *Deadly accurate bombs *With up to 50 robots on screen at a time, this game cannot be beaten. Top score, for Spectrum 16k or 48k.

ONLY £5.95

PRICES ARE FULLY INCLUSIVE. GUARANTEED DESPATCH BY 1ST CLASS RETURN POST. TRADE INQUIRES WELCOME

MICROMANIA

Send cash/cheque/PO to: Micromania, 14 Lower Hill Rd., Epsom, Surrey, KT19 8LT. Please write clearly your Name, Address and magazine & month this advert was seen in.

With so much of the 'my teddy bear is bigger than yours' syndrome in home computing these days, (BBC versus Spectrum, Dragon versus Oric, etc), I find myself being driven to acting like the proverbial dirty old man when it comes to buying software, so paranoid am I about the apparent inferiority of the Spectrum.

Carrying new purchases in my inside pocket in a plain cover, fearing the ubiquitous computer elitist pointing his finger at me, shouting "He's only got a Spectrum" across the street and everyone joining in with the derisive laughter.

It comes as a great relief, then, to find that enough people take this machine seriously to produce a wider range of software for it than seemingly any other, even if half of it was scribbled on the back of a beer-sodden envelope by some inebriate opportunist (me!!).

Well, it seems that one particular bunch of decidedly sober neo-entrepreneurs have even taken the trouble to update their programs — even though they were excellent before.

New developments

This company is Hisoft, whose original *Devpac* assembler/disassembler I briefly mentioned two months ago, and after a chat with them at the Earl's Court show in June, I managed to procure the updated and much-improved *Devpac 2*.

This consists of much the same package as the original, with the same large manual, and the two programs on one cassette. As they now offer more facilities, at the time of writing there was a second manual issued as a temporary adjunct to the old one, but after a little experience they are surprisingly simple to use.

The assembler, GENS2, has all the facilities as before plus a couple more; one of particular interest being the ability to

Adam Denning gens up on machine code development for the Spectrum

'include' files previously written into new programs, rather like a macro-assembler. The big advantage with this is that you can have, say, 20K of text in this included file, and yet take up only about 4K of memory to assemble the lot.

This is probably the most useful feature I can think of on an assembler, and so far I have managed to assemble 20K of object code using this method, despite having text files — ie the source code — amounting to about 40K, which simply could not have been assembled in one go before.

Mind you, one facility that I have great difficulty in divining a use for is the much-vaunted conditional assembly function, ie IF condition THEN assemble code ELSE don't, which nearly every assembler review tells you is so important — it isn't.

The other part of *Devpac* is MONS2, a disassembler/monitor, which can single step through code, do all a professional monitor can do, and produce text files for GENS2 from what it disassembles — heaven for any programmer.

The mechanics of single stepping (ie executing one instruction at a time) have previously been such that it has only been possible to step through RAM locations, and indeed both MONS1 and 2 have this limitation, but then I never in my wildest dreams could have

hoped for the ability to step through ROM — it just isn't possible, is it? Just wait until MONS3 comes out — it can! I received this version (pre-production) at Earl's Court too, and it leads me to one conclusion; if you write programs in machine code, buy *Devpac* — it is the best one currently on the market.

Nothing's perfect

Of course, there is always a cloud on the horizon — bugs. *Devpac 1* seemed to have none at all, but all the new ones have little problems which will no doubt be ironed out when they are released, but here is a list of them for future reference:

MONS2: very slight corruption in the files it produces for GENS — a quick look through the text solves this, however.

MONS3: I know this hasn't been released yet, but there is a problem with single stepping — sometimes it just won't do it.

GENS2: On return to Basic, the stack is corrupted, and if you don't issue a CLEAR command straight away (which resets the stack), the chances are that you will spuriously re-enter GENS and not be able to get out again.

Finally, all three programs disable the interrupts, so if you are single-stepping through something that relies on interrupts, beware! This is not a bug in the code, more one in the manual — Hisoft should really let us know.

(Stop Press: Hisoft claims all software is now debugged — watch this page.)

Bugs aside, I wouldn't be seen without *Devpac* — this is a wholly professional piece of software that at £12.50 is good value.

Whilst on the subject of machine code, it seems that a lot of people are put off it because someone has told them that it's hard to get to grips with, and they can find no suitable literature to convince them of the contrary.

In an attempt to fill this gap, therefore, Melbourne House brought out a book some time ago called *Spectrum Machine Language For The Absolute Beginner* — a title that was

incidentally ripped off from Steven Vickers' suggestion in the Spectrum manual itself — but there's nothing wrong in that. There is, however, something wrong in a book written specifically for beginners that contains numerous confusing errors, and unfortunately a few ghastly mistakes have slipped through.

Some examples: page 120: they state that the 'SLA' instruction can only operate on the accumulator — someone had better tell Zilog in that case! On the same page — "This is effectively multiplying 'A' by 2 as long as nothing is transferred to the accumulator" — they mean from the accumulator.

On page 136, where they are talking about reading the keyboard, they quite rightly say that a reset bit in the relevant input port corresponds to a key pressed. But then all the routines they give assume exactly the opposite to be true.

Then again, the section on the attributes file on page 143 consistently refers to 60 hex when it really should be 5A hex.

My recommendation goes to the books from Shiva and Granada publishers on this subject as they are not only less

patronising, they are also to a large extent correct.

At the very same show, I picked up a copy of Imagine's new game, *Jumping Jack*, which is one of its better games, being a sort of 'Frogger' thrice removed and at least three times as difficult.

No frogs — just a lot of lines with moving holes in to jump over. Each time you jump, a new hole is generated, so the only way to ensure success is to take every chance you get and traverse each level in one go, otherwise there are too many holes to contend with. More interesting than a lot of rival games.

Hisoft is at 60 Hallam Moor, Liden, Swindon SN3 6LS.

Oh! And a box of double-density eight inch floppies.

This month, Ron Stewart dons his camouflage gear and goes on the rampage

There are, in my humble opinion, three types of Atari owner. The first is the person who plays war games and bought an Atari on the strength of *Eastern Front*, Chris Crawford's simulation of Operation Barbarossa, in which the main protagonists were the Germans and Russians in the Second World War. The second is the person who bought the Atari first and then *Eastern Front*, and the third, the person who has not even seen *Eastern Front*.

If you are one of those in the third category can I suggest that you at least try to see *Eastern Front*. You will be surprised at the graphics and smooth scrolling, the computer also plays a mean Russian. I don't intend to review the game, many people have done so before me. Instead I want to look, for the benefit of those of you in the first two groups, at new computer war games that have appeared on the market since.

Close Assault

The first of these is a recently released game from Avalon Hill. This company will be known to many wargamers as a manufacturer and publisher in the forefront of board wargaming. To many in the computer field Avalon Hill is just a company that produces computer software at a reasonable price, but often the programs are not all that they should be.

Close Assault is a computer version of a board war game known as *Squad Leader*. This game has, over the past two or three years, become one of the top sellers in the war game world. You are placed in command of a number of squad level groups (about 10 men) and you have full command over all of their actions, what weapons they carry, where they go, and who they fight.

With many add-on games, *Squad Leader* has become a giant with a giant set of rules. *Close Assault* has gone back to those early days with a small, but extremely playable system in which the computer or another human will play one of the sides.

On opening the box you are confronted with a 40K cassette or disk, a colourful mapboard, cardboard counters, a record pad

and a rules booklet. The mapboard details one and two storey buildings, roads, woods, walls etc, and has a pattern of hexagons overlayed on top to regulate movement and position. Each hexagon is given an alphanumeric code.

The counters represent the squads of men, each nationality having a different colour; blue for the Germans, brown for the Russians and green for the Americans (What! No Tommies?). Each squad counter is allocated an identification number and squads come in three groups; elite troops, riflemen and four man gun crews.

On loading the game the computer will ask various questions such as what scenario do you require and who will be commanding the countries involved. It will then go on to ask you to allocate start positions to your squads on the battlefield. This point can be crucial to the rest of the game and defensive positions must be chosen well.

The computer holds each mapboard hexagon and its contents within its memory. If you are in a hexagon directly in front of a building you will obviously not be able to see or fire into the hexagon directly behind that building. This is known as line of sight and it will have a great bearing on the way you play the game. Two storey stone buildings make good defensive positions, for instance, but are useless if you are on the attacking side.

After placing your squads in position you must allocate the weapons that are available to you. These include three different types of machine gun, as well as flame throwers and demolition charges that can be allocated to the elite squads only. These elite squads also have one smoke charge that can be fired to give you cover while moving.

Leaders are also allotted to squads to try to stop them from losing their morale and running from the battlefield. There are less leaders than squads and they must be allocated to the key squads in your battle plan. You must be especially careful of one leader for he represents you. If he is killed in the battle the computer will take over both sides and continue to the end without consulting you.

After this setting-up period the game itself commences. In each turn you will go through a series of fire and movement phases controlled by the computer. All you have to do is enter the position of the squad and where you wish to move or fire to. Only experience will tell you the best places to go and the best ranges for each weapon but the rules booklet does give some clues.

You must also take account of the "Fog of War". Enemy units will remain hidden until your troops get close enough to spot them. In some locations this can mean that you will not know of a squad's presence until you literally trip over them. The game lasts for 10 turns and a game will usually take about an hour and a half to play.

I think this is the best game of its type around and it rises head and shoulders over Avalon Hill's other two offerings in the same category. These being *Tanktics* (early Chris Crawford) and *Dnieper River Line*. Anybody who bought either of those two and thought them a bit duff should not be put off from buying *Close Assault* and if you want a departure from the grand strategies of *Eastern Front* then why not give it a try?

Close Assault is also available for the Apple and TRS-80.

Battle for Normandy

Battle for Normandy from Strategic Simulations Inc. is another type of war game that is as different from *Close Assault* as chalk is from cheese. It resembles *Eastern Front* in that the mapboard is displayed on the television screen. That is where the resemblance ends because Normandy has a lot more variants to deal with. It is quite a complicated game to play, not so much in the strategies themselves but in relation to the logistics of command.

On loading the game the computer will ask you if you want to play the historic game, in which all units, combat factors and leadership ratings closely resemble history, or if you want to change them around. This feature is great for the novice general as the Germans can be made to look as if their bullets were made of cream and their boots of lead.

You also have to allocate supply expenditure to four main elements. They are fuel, general supplies, combat supplies and amphibious transport. Calculate these figures wrongly and your whole battle plan can go to the wall. To make calculating such supply figures more difficult they have to be entered two turns in advance. This is to simulate the time lapse between asking for the supplies and them being shipped out to Normandy from Britain. Weather is also a factor to consider as this will affect the amount of air support and supplies your troops will receive.

The game commences with the allied forces trying to land on the beaches. Not all of them can land at the same time because of the limited number of amphibians to get them ashore. Once ashore your troops will come into contact with the Germans almost immediately and this will also limit the amount of troops you can get ashore because units have to stop on contact with the enemy. So you can see, units have to be chosen carefully. Do not forget to land some depot units at the same time otherwise your forces could be left with no supplies and, in a weakened state, lose the beach-head.

When in contact with the enemy you are given options as to what units to use, how much air and naval support to give them and the type of defence or attack strategies to use. At the end of each turn you are given your victory level. Victory points are awarded for reaching certain objectives and points inland. The game lasts about three to four hours but unlike *Close Assault* and *Eastern Front* it can be saved at the beginning of each turn.

Battle for Normandy is available on 32K cassette and 40K disk and versions are also available for the Apple and TRS-80 computers.

Finally, a request for information. I am currently evaluating Maplin's new modem kit for a future article. If anyone has made the modem or is currently using it to communicate with other computers, please let me know.

Avalon Hill Games lives at 650 High Road, North Finchley, London N12.

Inside...
The New ZX Microdrive!
Latest software...
Latest prices...

The ZX Microdrive- and more!

For some time now, the new ZX Microdrive has been the subject of much discussion. Which is only to be expected, when the object of everyone's anticipation is *completely* new to the world of computing.

Microdrive provides high-speed access to truly massive storage. With just one Microdrive, you'll have at least 85K bytes of storage, and the ability to LOAD and SAVE in mere seconds. Yet the ZX Microdrive is about the size of a Spectrum mains adaptor, and costs less than £50!

First stocks are now in. Microdrives will be released on an order of priority basis. Spectrum owners who purchased by mail order, direct from us, will be sent full details including how to order, in a series of mailings that begins with the earliest names on our list.

And if you didn't buy by mail order?

Don't worry — for a colour brochure with full information on Microdrives, including how to order, just send us your name and address (use the coupon at the back of this issue of Sinclair Special). But remember, the sooner you send us your name, the sooner you'll get on the list.

Of course, there's much more to Sinclair than Microdrives, as you'll see on these pages. The latest releases of Spectrum and ZX81 software have been amongst the most successful ever. Prices of most established Sinclair products are at their lowest ever. To buy what you want, just use the Order Form.

Until the next issue of Sinclair Special, and more good news ...

Nigel Searle

Nigel Searle, Managing Director,
Sinclair Research Ltd.

PS: Come and see us — and all that's new at Sinclair — at the PCW Show, Barbican Centre, from Sept 28th to Oct. 2nd. We'll be pleased to see you!

ZX Microdrive System preview!

ZX MICRODRIVE

At least 85K bytes storage, loads a typical 48K program in as little as 9 seconds: £49.95.

ZX MICRODRIVE CARTRIDGE

Compact, erasable, revolutionary. Complete with its own storage sleeve. Contains up to 50 files, with a typical access time of 3.5 seconds: £4.95.

ZX INTERFACE 1

Necessary for sending and receiving data from ZX Microdrive. Includes RS232 interface, enables creation of local area network of 2 to 64 Spectrums. Attaches to the underside of your Spectrum. Purchased with ZX Microdrive, just £29.95. As separate item, £49.95.

Six new ways to make more of your Spectrum

Take a look at these brand-new titles. Each is an outstanding new program using the full potential of the Spectrum, for games with stunningly animated graphics, for strategies of fiendish cunning, for masterly applications of computing capability...

Cyrus-IS-Chess Based on the Cyrus Program, which won the 2nd European Microcomputer Chess Championship and trounced the previously unbeaten Cray Blitz machine. With 8 playing levels, cursor piece-movement, replay and 'take-back' facilities, plus two-player option. The 48K version has many additional features including an extensive library of chess openings. For 16K or 48K RAM Spectrum.

Horace and the Spiders Make your way with Horace to the House of Spiders, armed only with a limited supply of anti-spider-bite serum. In the house, destroy the webs before the spiders can repair them. Then destroy the spiders, before they destroy Horace! Undoubtedly the creepiest Horace program ever produced! For 16K or 48K RAM Spectrum.

Computer Scrabble The famous board game, on-screen – with the whole board on view! A huge vocabulary of over 11,000 words. Full-size letter tiles, four skill levels – the highest of which is virtually unbeatable. For 1 to 4 players. For 48K RAM Spectrum.
(SCRABBLE trademark and copyright licensed by Scrabble Schutzrechte und Handels GmbH – a J.W. Spear and Sons PLC subsidiary.)

Backgammon A fast, exciting program, with traditional board display, rolling dice and doubling cube. Four skill levels. For experts – or beginners. (Rules are included – it's the quickest way to learn the game.) For 16K or 48K RAM Spectrum.

FORTH Learn a new programming language, as simple as BASIC, but with the speed of machine code. Complete with Editor and User manual. For 48K RAM Spectrum.

Small Business Accounts Speeds and simplifies accounting work, produces Balance Sheets, Profit and Loss information and VAT returns. Complete with User manual. For 48K RAM Spectrum.

Overleaf – your Sinclair order form.

Latest ZX81 software

Prices round-up

These three new cassettes offer two totally different challenges to you and your ZX81. The games — like so many ZX81 games today — really do use the ZX81's capability. The FORTH program is a fascinating extension of your own computer understanding.

Sabotage. Defender or attacker? The choice is yours in this exciting game.

Be the guard and defend the ammunition in the compound — or be the Saboteur and attack it!

Written by Macronics for a ZX81 with 16K RAM. Cassette price: £4.95.

City Patrol. You are the Commander of a

laser-firing ship. Your task is to intercept and destroy alien suicide ships descending on your city.

Written by Macronics for a ZX81 with 16K RAM. Cassette price: £4.95.

FORTH. Discover a new programming language which combines the simplicity of BASIC with the speed of machine code. FORTH's compiled code occupies less than a quarter of the equivalent BASIC program and runs ten times as fast. Free User-Manual and Editor Manual with each cassette.

Written by Artic for a ZX81 with 16K RAM. Cassette price: £14.95.

ZX Spectrum 48K
now just **£129.95.**

ZX Spectrum 16K
now just **£99.95.**

ZX81 now just **£39.95.**

16K RAM Pack for ZX81
£29.95.

ZX Printer now just **£39.95.**

1.2A ZX Mains Adaptor
£7.95.

Printer Paper (5 rolls)
£11.95.

How to order

Simply fill in the relevant section(s) on the order-form below. Note that there is no postage or packing payable on Section B. Please allow 28 days for delivery. Orders may be sent FREEPOST (no stamp required). Credit-card holders may order by phone, calling 01-200 0200, 24 hours a day. 14-day money-back option.

While details of the Acorn Electron have been shrouded in mystery for both users and press alike, Acornsoft's activities have been rather less 'classified'. In addition to releasing several new programs for the BBC computer it has announced plans for 12 programs to run on the Electron, which will be launched at the same time as the new machine.

Most of the Electron software is already available for the BBC Micro, and some has undergone minor surgery to make it suitable for the new model.

There are six games titles in the release — *Monsters, Meteors, Snapper, Draughts & Reversi, Chess* and the new *Starship Command*. Programs of general interest make up the dozen — *Creative Graphics, Graphs & Charts, Tree of Knowledge, Lisp, Forth and Personal Money Management*.

ACORN ANGLE

Clive Williamson reviews Acorn's new programming languages and some BBC games.

the BBC machine will be pleased to know that both languages are now available for them on disk as well as cassette.

Forth seems to be gaining in popularity with micro users, as it is very fast in operation —

major program examples, but the book is full of short program sections illustrating the text.

BCPL is block-structured, like Pascal, and the Acornsoft version has been written in conjunction with Martin

and enthusiasts though — the whole lot costs £99.65! The book *BCPL on the BBC Microcomputer*, to be published later this year, should help those who just want to find out about the language, as it will cost a more modest £7 or so.

One frustrating aspect about all this language activity is that there is currently nothing on the market in the way of programs to run under Forth, Lisp, or BCPL for the BBC Micro. Acornsoft says it is planning some support soon, with a Forth Welcome Pack in the pipeline, and a number of BCPL utilities are now under development.

The first programs to see the light of day for BCPL users are likely to be in a *Calculation Package* giving floating-point, decimal fixed-point and fast Sine, Arcsine and square root for graphics routines. In the meantime we will have to struggle through, left to our own devices.

New BBC games

If all that sounds rather technical, let me tell you about the new games for the BBC Micro. Four new titles have appeared recently, and very good they are too!

Missile Base is a hair-raising attempt to defend Moon-base against salvos of deadly neutron missiles falling from space. Either joysticks or the keyboard will control your gun sights, and a separate key is required to fire from each of three defence stations.

Some strategy is involved, as you only have nine rockets in each station, and some of the falling missiles dodge your fire. The key arrangement is slightly complicated, but the game is enjoyable and colourful.

Acornsoft's *Snooker* is an excellent computer version of the game. It is essential to have a colour TV to play, of course, otherwise you could end up

Acornsoft's new programming languages for the BBC Micro Model B.

Only *Meteors* is significantly different from the Beeb version being in black and white instead of colour. The other programs have all had the Mode 7 displays removed, as the new machine is not capable of supporting teletext. The programs are slightly cheaper than their BBC counterparts, selling at £9.20 including VAT.

Acornsoft has been very active with languages in the period up to the Electron launch date, having now completed a BCPL package for the BBC Micro, and published the long-awaited manual to go with Forth.

The fact that both Forth and Lisp are in the initial batch of programs for the Electron is indicative of Acornsoft's seriousness in this area, and owners of

typically five times faster than Basic — and very little space is needed for program storage. It encourages the writing of well structured programs and is very easy to de-bug in the initial stages.

Acorn Forth

The new book *Forth on the BBC Microcomputer* has a very good pedigree, as it has been written by Richard De Grandis-Harrison, chairman of the UK Forth Interest Group. Costing £7.50, it acts as a general introduction to the language.

A glossary details all the Forth-79 standard words, and there are sections covering topics such as graphics, sound, loops, the stack and defining new words. Surprisingly, there are no

Richards, the originator of the language. One of its major features is its transportability, and as an aid to programming it has a large number of different types of loops.

The BCPL compiler generates a very compact intermediate code, called CINTCODE. It is this code which is interpreted, so that although BCPL is slower than machine code, it does have a considerable speed advantage over interpreted languages such as Basic.

Acornsoft's BCPL package includes the interpreter in a 16K ROM, a dual standard 40- or 80-track disk containing the compiler and library routines, and a bulky 450 page user guide.

The price makes it more suited to educational establishments

Missile Base for the BBC — an old favourite in a new version.

Hopper — a new version of the arcade classic from Acornsoft.

potting the wrong balls.

Played with joysticks or keyboard, *Snooper* is very engrossing, and for once here is a game designed to be played by two people. It is possible to apply backspin or topspin to the cue ball, and the 'length' of the cue on screen determines the strength of the shot. The table is nicely designed and includes a traditional score-board.

Hopper is the Acornsoft answer to a less war-like computer game than most. It is a fairly standard version of *Frogger*, in which the player has to guide frogs across a hazardous road full of moving traffic and over a river by leaping onto floating logs and the backs of turtles.

The object is to get five frogs safely into their lairs on the other side of the river bank without getting squashed or drowned, and there is an added problem in that a time limit is set for each journey.

Star Trek Revisited

One of the best games released for the BBC Micro in recent months is an original one called *Starship Command*, which has been loosely based on the Star Trek theme. You are in charge of a Battle Starship, and are sent into space to fight off an invading alien fleet.

The main controls are thrust, brake, rotate left or right and fire; and the ship appears at the centre of a large 'window' forming the major part of the display. The view of space drifts and spins past as the ship manoeuvres, which is an extremely odd sensation at first.

On the right of the screen are long and short range scanners showing the position of the alien ships, some of which can be invisible on the main screen. Needless to say the aliens are

always in hot pursuit. Also visible are the ship's energy banks, which play a vital part in the game.

Your starship is equipped with force shields for protection and torpedoes, and it is possible to

destroy the enemy ships either by repeated fire or by ramming. Both are a drain on your energy banks, as are hits to your ship by the aliens' torpedoes.

Escape capsule

When you are under severe attack and the energy levels get dangerously low, the only thing to do is launch an escape capsule. If you make a successful getaway, the Star Fleet Admirals will review your mission, and 'decide whether you are a fit person to command another of their starships'.

The presentation, sound effects and graphics are really excellent, and by using the minimal two colour Mode 4 display (in attractive blue and white) the author, Peter Irvin, has left himself plenty of room to program very sly control of the aliens.

It is up to the player to develop the tactics needed to survive in the dogfights. A high score is difficult to achieve, but despite that — or perhaps because of it — *Starship Command* is a truly

Starship Command.

obsessive game and can be thoroughly recommended.

All the new games from Acornsoft cost £9.95 for the BBC Micro. *Starship Command* is also available on disk for £11.50, and on cassette for the Electron at £9.20.

Full details from Acornsoft Limited, 4a Market Hill, Cambridge, CB2 3NJ.

Chip Chat

Acorn's speech processor for the BBC Micro has been released at last. All over the country software reviewers are patiently teaching their computers how to count, and suffering comments like "ACORN COMPUTERS ARE VERY JADED FROM 3 O'CLOCK ON!" — or being told to "TRY TYPING THAT LAST INPUT AGAIN".

The initial Word Phrase Read Only Memory — or PHROM — contains just 160 words or word parts, two lengths of pause, two tones and a couple of bizarre sound effects for <TAB> and <RETURN>. Acorn have made provision for a total of 16 such PHROMs, so the potential vocabulary is pretty large, but there is no indication of a date when more chips might be released.

Once fitted, the processor leaps into life when the SOUND command is used, in the form SOUND -1,X,0,0 where X is the number (between 127 and 291) of the desired word or word-part. Thus it is possible to work out sentences from the present limited vocabulary, store the number in data statements, and have the computer spout obscure remarks in the middle of your games programs. "THE DATA IS INCORRECT, IF YOU MUST KNOW!"

Another simple way to obtain results is to try SOUND -1,GET, O,O — which then uses the ASCII codes generated by the keyboard to have the computer speaking the alphabet as you type

in upper case, and a selection of numbers and some of the other words when using lower case. This has obvious applications for the visually handicapped, but the system tends to collapse when you type a comma and are told 'THOUSAND' and hear nothing from the <DELETE> key at all! It is in this mode that <TAB> gives a 'space zap' sound and on pressing <RETURN> a somewhat prolonged imitation of a carriage return on a manual typewriter.

Menacing tones

The quality of speech is generally good, if somewhat 'metallic'. BBC newsreader Kenneth Kendall was selected for

the task of being digitised, but it is rather hard to identify him from the end result. The diction is certainly clear on most of the words, but the tone of delivery is rather flat, and makes the computer's simplest requests sound somewhat threatening. "PLEASE PRESS THE RED BUTTON NOW!" comes over with particular menace. The situation is not helped by the lack of provision for volume control in the SOUND command governing the speech.

The vocabulary is a strange miscellany, and I can't help feeling that Acorn were shooting in the dark a little when they compiled it — as it doesn't seem particularly suited either to

Acorn's speech processor in position on the BBC.

games or educational use. There are no directions, except UP and DOWN, and few words connected with computing in general or the BBC Micro in particular. Neither are there many friendly or conversational words like HELLO, HOPE or GET, although it will say PLEASE and THANK YOU.

Having said that, there is the promise of other vocabularies for the future, and some will be available as plug-in cartridges, which will work with the BBC machine after the speech upgrade has been carried out by a dealer. The upgrade includes a serial processor and a new socket for the left hand side of the keyboard, both necessary in order to get at soft-

ware in Cartridge ROM form, but the sockets were not ready for fitting at the time this review was written.

Bearing in mind the limited vocabulary of the first Word PHROM, and the fact that the speech upgrade is the 'gateway' to software and data in Cartridge ROMs in the future, I can't help thinking that Acorn should have released the Speech Processor for rather less than the £55 they are asking. Particularly as they are bound to recoup any losses incurred now by improving the future sales potential of Cartridge ROM software. "YOU HAVE A NEGATIVE CHARACTER. I MUST SWITCH YOU OFF NOW!"

Clares easy-to-use joysticks for the BBC Micro.

Better joysticks

Those of you who have struggled with the Acorn joysticks will know that they must have been designed for American hands. They are huge! Not only that, they are wired up the wrong way round, so that you can't hold them comfortably and get the movement you expect on the screen.

A new joystick design from Clares aims to get round the problems — and nearly succeeds. Their version is wired so that it works logically when you hold it the 'normal' way round — and the fire button is in a better position for frantic stabbing during fast action. In fact I play a much better game using the Clares joysticks, which may be because they use better quality potentiometers, and they have

been made so that the stick stays in its last position, which gives a nice firm feel. The cable is slightly longer than Acorn's, so you sit at a more comfortable distance from the screen.

Where Acorn's joysticks are too large, the Clares equivalents are slightly too small for most adults, and I think that they are best suited to children's hands. It would help if both the stick and the handle were slightly longer, and the fire button was broader, and hence less painful on the thumb after prolonged use.

Having said that, the Clares joysticks are nicely made, and I would rather use them than Acorn's despite the higher price of £17.95 per pair.

Clares, Providence House, 222 Townfields Road, Winsford, Cheshire CW7 4AX 06065 51374

Proccube

Another handy graphics routine for the 32K BBC from R A Lober, this program draws isometric views of cubes.

Fun for all the time for C

Brainwave '83 is a technological Aladdins Cave... a family wonderland bursting with the latest and the greatest in computers, video games, electronic kits, books and magazines... you name it, you'll find it at Brainwave '83. It's your chance to see,

to compare, to discuss and to buy on the spot.

Bring the whole family

Brainwave '83 is the one show for

everyone. Trains and buses take you to the door, there's free car parking, and inside, you'll find rest rooms, refreshment stalls and even a creche.

Remember, remember... the 4th, 5th and 6th of November

You'll have noticed that Brainwave '83 takes place over the weekend, (10-7pm Friday and Saturday, 10-5pm Sunday).

That means you'll have plenty of time to browse at Brainwave '83.

And on Saturday, 5th November you're also invited to a huge FIREWORK party.

Entrance is completely free.

NEC Birmingham 4th, 5th & 6th

- * HOME COMPUTERS
- * VIDEO GAMES
- * HOME MANAGEMENT
- * FIREWORKS
- * XMAS PRESENTS

Family just in Christmas

are also available. Phone for information on discounts.

Weekend shopping...

Money saving voucher offer

Tickets at the door will cost £3.00 for Adults, £1.50 for children (up to 14) or £7 for a family group ticket (4 persons).

Just in time for Christmas - spend a day with us at the first ever home computing, video and electronics family show. Fill in the coupon now and send it to Brainwave '83, or phone 01-747 3131 (during office hours).

However as a special show offer just fill in the coupon and you will receive your money saving vouchers giving 50p off the adult and childrens price, or £2 off a family ticket. Advance party bookings for over 20 people

PRINTING TO A BUDGET

Printers have never been cheaper and prices are falling all the time. Which printer should you choose for your microcomputer?

Not long ago, the cost of buying a printer was just too much for most home micro users, but that is all changing as prices keep coming down.

Printers can be very useful; especially for printing out listings to facilitate debugging of programs. Even word processing is possible now at a very low cost, thanks to new word processing software packages for home computers and the competitive price of daisywheel printers.

Just like the prices of microcomputers, prices of printers are coming down — way down. A daisywheel letter quality printer under £1,000 used to be news indeed. Then it was £800, then £500. Today, if you really want a daisywheel printer and are on a budget, spend under £400 plus VAT and you could have a typewriter too.

Prices of printers don't only exclude VAT — they often exclude one vital piece of information — what will the interfaces cost? That vital cable and connection to link the micro to a printer. Prices of printers should be examined carefully to see whether this vital price is included. Without it, the printer is useless.

Today, if you want to spend a basic 'under £500 plus VAT', there are three main choices. A dot matrix printer of the type that has been made popular by Epson; there are lots of lower priced models now. A daisywheel printer for letter quality correspondence. And the daisywheel printer which also has a keyboard — known as a typewriter. Not only do you have the advantage of better quality printing, but an extra keyboard when it really isn't worth plugging in a computer and loading the word processing package.

If you want a complete word processing package including the computer, a daisywheel typewriter/printer, a stand and the word processing package, it's possible for just £980. SPT Electronics has a complete system which includes a Commodore Vic, a cassette recorder, its word processing package, The Quick Brown Fox, and an 80-column expansion board. Just over the list price of an Apple IIe without a monitor, disk drives or software.

Set your budget before starting to examine the printer market. After all, the ZX printer costs under £40, but just isn't everyone's cup of tea. Once you have a figure in mind find out what type of connection is fitted to your micro. Does it use the popular parallel/Centronics type, the serial RS 232C or the IEEE 488? It's most likely to be the parallel/Centronics type.

Now your budget and interface socket is known, which of the three types of

printer will be right for you? The answer will not rest on price alone. Most of the printers we mention cost under £400 plus interface, so if you had a choice what would it be?

Dot matrix printers have been much maligned because the result looks like computer printing, but they have radically improved over the last few months. Some have a choice of typeface — the condensed option can make a very acceptable result for correspondence. The graphics facilities are also improving rapidly and a dot matrix printer can be more versatile than many people thought possible.

Compared with daisywheel printers with speeds in the lower price range of up to 20 characters per second — the dot matrix can go four times faster and more. To produce a daisywheel printer with a high-speed operation takes you well into the four figure plus price area.

However, if you have to choose between quality of reproduction versus pure speed, there is no contest. Daisywheel wins hands down. For a few letters or invoices the longer time producing them won't matter much and the higher quality result creates a better impression.

Sometimes it's easier to produce a letter, note or label using a genuine typewriter, which may seem sacrilege to computer buffs. Why bother to plug-in the computer and load a word processing program, when instead you can just slip a piece of paper into the typewriter and produce the letter? The same applies if someone in your home wants to produce a printed result and doesn't like the computer. Plus those little jobs like labels and notes.

One reason may really appeal to you. When your micro goes on the blink, and reliability isn't 100 per cent by any means, the typewriter can still be used to produce letters, reports, notes, envelopes, labels etc. All without your broken down micro. A choice well worth considering especially as this is currently the cheapest way of getting a daisywheel printer.

Where the microcomputer has a Centronics connection or parallel interface or even the RS 232C, the only extra you need is the cable to connect printer to computer. On average this will cost around £15. However, if you have a Sinclair Spectrum and no standard interface what do you do? Wait for one to appear, or make use of one from the independent companies?

Kempston Electronics produces a Centronics interface for the Spectrum which will work with any printer like the Epson, Seikosha, OKI Microline and similar

models. Included is a special driving software package that lets you print up to 128 characters per line. The interface also recognises LLIST and LPRINT so that programs can be listed directly from the Spectrum. The complete price is £45. For an extra £13.90 a word processor called Tasword Two can be added.

As an alternative to the Kempston Electronics product, the ZX LPrint from Euroelectronics allows the use of a dot matrix printer and gives up to 32 characters per line. This costs around £30.

Hilderbay produces its own interface for the Spectrum which comes complete with a word processing package at no extra charge. Priced at around £45 this is a very attractive proposition.

Of if you are satisfied with the quality, buy the ZX printer and spend less than £40.

Apart from the Sinclair Spectrum another area of large scale micro sales must be the Vic and Commodore 64. Here a whole host of special interfaces have been produced so that these micros can be linked to virtually any printer available.

The one you choose really depends on your budget and the degree of sophistication and versatility required. You can spend from under £30 to over £100 depending on the features that are needed. While you are getting an interface consider that for a few extra pounds there are a lot of extra facilities to make your computer system more versatile.

Supersoft produces Printlink, which consists of a cable that connects the parallel printer to the user port of the Commodore 64, plus software to make the printer behave just like a Commodore product. This item costs £26 or £28 depending on whether the software has been supplied on tape or disk.

JCL Software supplies a CBM64 IEEE 488 cartridge which plugs into the rear of the Commodore 64 or Vic and accepts a standard Pet/IEEE lead to connect to the peripheral — which in this case will be a printer. This cartridge costs around £60.

Impex Software supplies an interface module for the Vic or Commodore 64 so that either of these micros can be interfaced with a range of printers including the Epson, Itoh, Okidata, NEC, Smith Corona TPI and Gemini 10. This multiple interface is hardware-driven and plugs into the serial port. Price £79.

Stack Computing Services produces a Centronics parallel interface which consists of a cable and software cassette, price £29. There's also an RS 232C interface available for the same price.

ZX Lprint	£30	Euroelectronics, Zlin House, Oakfield
Hilderbay interfaces with word processor included free	£45	Street, Cheltenham, Glos GL50 2UJ
		Hilderbay 01-485 1059

Commodore information 0753 79292

SPT Electronics — complete word processing system and the Quick Brown Fox 0621 868484

However, the Interpod from Oxford Computer Systems is probably the most sophisticated of the lot, and is certainly by far the most expensive. It is an intelligent interface which fits directly into the serial port of the Commodore 64. The Interpod features both RS 232C and IEEE interfaces so that both ports of the 64 can be used without any further operation. Apart from this feature, the Interpod is the only one which is completely transparent to the machine and software, according to Oxford Computing Systems. And this is made possible because it's the only interface which doesn't use the 64's cartridge slot. The Interpod costs £125.

Of course, you could also use the printers supplied by Commodore which are also low in price, especially the newly-launched 1526 dot matrix printer. This model has a reversed field facility to allow white characters on a black background, instead of black on white. Programmable characters can also be produced. The new Commodore 1526 costs £345 including VAT.

And if more than just a plain printer is required—Commodore now has a printer/plotter working in four colours, which certainly adds impact for graphics print-outs. Producing black, blue, red and green using four pens, this is a system pioneered by Sharp for its pocket computer. The plotter costs just £169.99 including VAT.

If you own a BBC micro, an Oric or a Dragon, then a Centronics type connector cable will cost around £18. While a BBC 25-way D type for use with the RS 423 costs around £10.

For the Apple, a suitable printer card will be needed for slot one and this can cost from around £70. While the IBM Personal Computer has a parallel and RS 232C socket that can be used.

More than any other peripheral, printers should be seen working before purchase, preferably with your own brand of micro. Otherwise that attractive printer in the window of your local dealer can become a big problem once it has been taken home. Make sure you aren't just sold a printer and told it will work with any computer using a suitable interface. The interface must be bought at the same time as the printer. Or buy the independent interface and try it together with the printer of your choice with the same brand of micro-computer as your own.

Printers have never been cheaper and prices are getting lower all the time. Who would have thought that a printer would be available for under £500 to produce daisywheel quality text? Or that a dot matrix printer could cost under £300, or a daisywheel typewriter/computer printer could cost from just £350.

We have put together a list of typewriters that can be used as printers, daisywheel and dot matrix printers, but they are just the tip of the iceberg as the market is growing all the time.

There has never been a better time to buy a printer for your microcomputer whatever you intend to use it for. ■

It's not just the price tag that puts **CALCMASTER** ahead of the competition

Obviously being the most competitively priced 8 & 16 bit business 'CALC' system available today is good news.

And the fact that it's from the same stable as the outstandingly successful **SAPPHIRE MARS** — the easiest to use full structured modelling system available — shows CALCMASTER'S undoubted excellent pedigree.

But what really puts CALCMASTER in a class of its own is its unique design concept as the low cost, easy to use, basic utility for business planning and control. **Not just another 'CALC'!**

So, CALCMASTER, based on our years of business modelling experience, is a low cost, easy to use and flexible 'personal' business planner. Yet with enough real muscle in the right places to quickly make full use of your micro to get to grips with those 'everyday' managerial situations and events where your decisions count.

The **EASE OF USE** that comes from entering your calculations in English and having a 'rolling window' to view all the elements of your model, however large.

The **POWER** contained in CALCMASTER'S 1,000 cell matrix to enable you to model 'day to day' all your business and departmental activities that require quick and accurate analysis, appraisal and control. Yet with enough in reserve to handle larger functions, even including the consolidation of small to medium size models using the unique 'Read' 'Write' and 'Nested Run' facilities.

The **FLEXIBILITY** to model and assess a whole range of business and personal activities, not just the financials!

The **WIDESPREAD AVAILABILITY** that comes from CALCMASTER'S suitability for most micros with either CP/M* or CP/M86* operating systems and an 80 character screen width with at least 64K of memory and a single floppy disk drive.

So almost at a flick of a switch, you can now ensure that you and your company, like CALCMASTER, stay one step ahead of the competition.

Of course, when you need to move up to a more powerful system, CALCMASTER leads you naturally to SAPPHIRE MARS. Because it's totally integrated to CALCMASTER both your experience and data are not wasted and you have the complete business planning system for **ALL** your needs.

But first things first. To order CALCMASTER, and its superbly designed manual, please clip the coupon and enclose your cheque or credit card details and we will send you CALCMASTER plus details of the extensive **SAPPHIRE MASTER RANGE** of business software.

To: Sapphire Systems Ltd., 1-3 Park Avenue, Ilford, Essex IG1 4LU.

RAIN

SIX MONTHS AFTER IT WAS ANNOUNCED, THE DEC RAINBOW APPEARED

When the massive IBM corporation announced it was going into the personal computer market some two years ago now, the rest of the large computer companies felt they had to follow suit and if possible 'out-do' IBM in this highly competitive market.

Digital Equipment Corporation, the second largest computer company in the world, was one of the first to announce two personal computers and in January this year the Rainbow and the Professional computers were launched in the UK. Six months later the first Rainbows started to arrive, well behind schedule, and we tested one to see how it compares with the IBM machine and the 90 or so other 16-bit computers competing in this crowded market.

So after this long wait what do we have? It seems logical to compare the Rainbow with its major competitor, the IBM PC, so we will take it through point by point.

In looks the Rainbow stands up well. It has a cream and grey processor unit housing the main processor board, power supply and disk drives. Neatly designed, the box does not have the slab-like look of the PC. The same is true of the screen which is raked at an angle so that it can be read comfortably. The keyboard has a full QWERTY layout with a cursor keypad, numeric pad, 20 function keys along the top and a separate pad with FIND, INSERT, REMOVE, SELECT, PREVIOUS SCREEN, NEXT SCREEN, HELP and DO keys.

Staying with the keyboard it has a pleasant feel, though not as good as on the IBM. However, all the keys are where you expect to find them unlike on the IBM. A strange quirk though is that the caps lock light is not on the caps lock key but at the other end of the keyboard.

The screen is neatly designed with a white on black display of 80 characters by 24 lines. The character set is clear but the screen on our system had a disconcertingly unsteady display, which is bad for the eyesight. Users should check that the screen image on their systems is steady. Our problems were probably caused by a duff monitor rather than a system difficulty.

Inside the processor box are the Rainbow's two main advantages over the IBM PC. The first is the modular design. The power supply, disk drives and processors are in separate units that clip into the system.

Unusually, the two 5¼ inch floppy disk drives stand on top of each other in a

single unit and there is a space between this unit and the power supply for a Winchester disk as they become available. The advantage with this design is that as a unit breaks down it can be very simply replaced. More of this later when we talk about support and maintenance.

The second scoring point over the IBM machine is that the Rainbow has two processors instead of the IBM's one. These processors are the 8-bit Z80 and

the 16-bit 8088 (the same processor as the IBM).

The main operating system of the Rainbow is a combination of CP/M and CP/M-86 called CP/M-86/80. This will run both programs written for CP/M and for CP/M-86. If this sounds confusing, it isn't. All it means is that the user can choose to run 8- or 16-bit programs without having to worry which is which. All he has to do is load the disk, and the Rainbow identifies

RAINBOW

APPEARED IN THE 16-BIT PERSONAL COMPUTER MARKETPLACE. WAS IT WORTH THE WAIT?

the software and runs it on the 8-bit processor or the 16-bit processor automatically.

The advantage is that this gives the Rainbow a potentially much larger base of established software than the IBM PC. It is not necessary for DEC to produce vast quantities of software because there is already a lot of fairly good quality software running under the CP/M operating system that can be converted

to run on the Rainbow.

This being the case, one has to ask why it has taken DEC so long to come up with any software at all, since IBM has managed to establish a much larger base of software for its machine and that is all running on the 16-bit processor.

As it is, the Rainbow has an acceptable choice of software now and users can confidently expect that more will emerge fairly quickly. Incidentally, DEC has set up

a software centre in the UK and it is expected that much more applications software (16-bit) will come from there in due course.

The system is well packaged and comes with good documentation. Setting up is comprehensively explained in a User Kit. No special tools or even screwdrivers are required to attach all of the relevant devices together.

DEC supplies three choices of printer — the LA50 which is a 100 cps dot matrix printer, the Letterprinter 100 which is a near letter quality dot matrix which can also manage a fast 240 cps in draft mode and the letter quality LQP02 which is a 32 cps daisywheel printer. These are the only printers supplied by DEC but have the primary advantage of being simple to connect and to get working — which is unusual with printers for microcomputers. We had some trouble with the LA50 but this turned out to be 'finger trouble' rather than the fault of the Rainbow — but then nobody is perfect. The LA50 proved reliable and has a very nice typeface for a low cost printer, much better than the equivalent printer for the IBM.

The Rainbow comes with an awful lot of documentation but it is well produced and easy to follow in the main. One niggling problem we had was that DEC forgot to include an overlay which gave the names of the function keys so we had great difficulty in finding keys referred to in the manual. If you buy a Rainbow make sure the overlay is included.

Starting the system up is a straightforward procedure. Once the system is switched on it has a self test routine which is a good way of finding problems before you start using the system. There is an easy-to-follow Set-up routine which allows the user to configure the system and the printer and make sure that all the variables allowed for on the system are set properly (eg keyboard click, screen display, keyboard language and so on.).

Once the system is up and working, though, and the user loads the CP/M-86/80 operating system, the problems start. CP/M has proved a very popular operating system in the past, but the fact remains that it is difficult to come to grips with if you are new to computers. Full marks to DEC for providing a manual that is easy to follow, but the user still has to learn a set of commands that are largely built up of hieroglyphics to do the simplest functions. It has to be said that this simply is not good enough. Considering the size of

weigh up the facts

On balance, is too much of your valuable time and effort taken up by mundane and repetitive statistics and bookkeeping?

The MICROFACTS integrated accounting system is already helping hundreds of users of microcomputer small business systems to manage their businesses more effectively and profitably, giving them time to make the crucial decisions.

Don't you think your business could benefit from tighter credit control, rapid and accurate financial reporting, reduced stock holding, comprehensive job costing, better customer service and many other advantages?

Make the right decision NOW. Find out how MICROFACTS can help YOU and take some of the stress out of your life.

The DEC LA50 100cps dot matrix printer — proved reliable and “much better than the equivalent printer for the IBM”

investment DEC has already put into this system, there seems little excuse for not making the operating system a little more straightforward to use.

It gets worse. This article is being written on a Rainbow 100 using the Select word processing package. In many respects Select is a dream to use. It comes with a training package that got us up and running in half a day. The package is both easy to use and quick. However, trying to get a working disk sorted out so we could get started proved a nightmare.

Rainbow dealers will throw up their hands at this and say it is all fairly straightforward and a reviewer should be able to cope with the well-described process of formatting and copying the working disk. Our reply would be that if it takes us a day and two calls to the DEC ‘hot line’ to carry out this simple manoeuvre, what about the user who has never used a computer before?

Which brings us neatly onto maintenance and a chance to say something good about the system. DEC provides two forms of support. The first is a telephone number to a series of experts who will try

and answer queries over the telephone. We used this service, got through very quickly and found the DEC personnel friendly, knowledgeable and helpful. They managed to sort out our problems over the phone.

The second level of support is for the hardware. If something breaks down, DEC will send an engineer who will replace complete units (thanks to the modular design) quickly and on the spot. The faulty units go back to DEC and are refurbished so that they can be recycled. This service is free for the first year,

SPECIFICATIONS

CPUs: Z80 and Intel 8088.

Memory: 64KB RAM as standard, expandable up to 256KB.

Storage: Twin 400KB 5 1/4 inch floppy disk drives with the option of two more or a 5MB Winchester hard disk.

Operating system: CP/M86-80 as standard, MS-DOS (equivalent to PC-DOS) as an option but will only run the 16-bit processor.

Communications: Serial RS232C (printer) plus asynchronous port up to 9600 baud with modem control plus options for another RS232C and an RS422.

Price: Basic system £2360 excluding VAT. Extra floppy drives are £672 for two, the 5MB Winchester is £2346, extra 64KB RAM is £334, extra 192KB RAM is £739 and a colour monitor is an expensive £894. Maintenance is free for the first year.

Printers: LA50 is £609, LA100 Letterprinter is £1816, LQP02 is £1960.

anyway since it does not matter with general business packages whether they are 8- or 16-bit as long as they run adequately. All of these did and Select in particular was a pleasant surprise.

There is a lot of software ready and waiting for the Rainbow and users can

COMMENT

So how does the Rainbow stand up to the IBM PC? Points in its favour are the two processors, the flexibility this brings to the system and the maintenance offer. The second point in particular is significant. Smaller plus points are the pleasant keyboard (the touch is not as good as the IBM's but the layout is better), general styling of the system, the printer options are very good and the set up is very simple.

On price, the Rainbow gives the user an extra processor and larger disk drives for the same price as the IBM PC.

The minus points are that the operating system is not as good as PC-DOS (which runs on the IBM), and the screen display is not as good. Probably the most significant of these is the operating system. It could be rather a headache for users new to computers.

Looking at the Rainbow in isolation we can say that it is a pleasant system to look at, some of the software is very good and it compares favourably with many of the 16-bit systems on the market. It is a pity that it has taken DEC so long to get it to the marketplace though, since it is a system that is state of the art circa June 1982, and not August 1983.

The VDU is neatly designed but had a “disconcertingly unsteady display”

which is an astonishing offer on a machine that only costs £2,300. IBM only offers six months' maintenance and the user has to return the PC to IBM to get it repaired.

And so onto the software. DEC provided us with a wide range of software including Select word processing, Multiplan and Finar financial modelling, Comsoft's DMS database system and an Inventory Management package. This is a fairly good spread of standard micro-computer packages but it is difficult to tell whether an individual package runs on the 8-bit or 16-bit microprocessor.

This is largely irrelevant to the end user

confidently expect a lot more to be written for this system — the name of DEC will attract lots of software companies. ■

The Rainbow should be available from all Digital dealers, some of which are listed below:

Micro Business Systems in London (01-621 1122) and Edinburgh (031-333 1000), Guestel Ltd in London (01-583 2255) and Bristol (0272 277461), Ferrari Software (01-751 5791), Cytek UK (061-872 4682) and South Coast Computers in Dorset (0202 893040).

PROGRAM COMPETITION

1st PRIZE £200 2nd PRIZE £100 3rd PRIZE £50

We want even more listings for publication in *Which Micro?*, and to boost the incentive we have decided to re-run our immensely popular program competition.

The top three programs received before our closing date will receive one of the three prizes, *in addition* to the normal publication fee. All entries will also be considered for publication at our normal rates of £20 to £100 depending on length. Entries can be as short as you like (some of the best are) and up to a maximum of around 200 lines. This is what we are looking for: entries must be games, utilities, or educational programs for the Spectrum, Dragon, Vic 20, BBC, Oric, Commodore 64, Lynx or ZX81.

They must be 100% bug-free (please . . .!!!), and must be accompanied by a computer listing dumped straight from the final, working version of the program. Machine code programs must be accompanied by a complete assembly listing.

Entries should also be accompanied by complete instructions for entering and using the program. A cassette with at least one copy of the final version of the program on each side should accompany the entry.

Please remember that the cassette, the listing and the covering letter must all bear the competitor's **name, address, and telephone number** along with the name of the program and the **type of computer for which it runs**.

Finally, please do not send us your only copy of the program — we cannot return them.

JUNE COMPETITION RESULT

Winner £100 software voucher

COMPUTER PITFALLS

Last month we left you with the story of our typical end user and his experiences with the hardware of his Apple IIe system. We conclude with a report on some word processing software he has been using.

What is the first thing you want to do when your new micro is all plugged together and ready to be switched on for the first time? You want to use it, of course! It's so simple, that you would expect every manufacturer of personal computers to realise.

Unfortunately, very few of them do — the humble user, fresh from the arduous task of filling out owner registration documents, software licencing agreements and warranty cards, is expected to spend an afternoon grubbing in manuals to work out even the barest basics of how to operate the system.

Apple can't be praised too highly, then, for making the bookworm approach optional. All I had to do after putting the machine together was to insert a disk into Drive I and switch on. A suite of programs titled "Apple presents.....Apple" then took me straight into a presentation of the IIe's capabilities, and gave a step-by-step tutorial on how to make everything work.

For anyone unfamiliar with such fundamentals of computer operation as cursor control and using the disk drives, this must be the ideal introduction. The humorous style and animated graphics maintain a high level of interest, and continual tests on what has been learnt ensure that the lessons are not quickly forgotten.

One of the most dramatic savings in time and effort allowed by *Applewriter* is the word counting sub-program

Once the basics were mastered, I was able to proceed to some real work. Anyone who read last month's issue will remember the priority I gave to word processing in my requirements. Apple's official word processor for my computer is *Applewriter IIe*, a newly improved version of a program which has been around for a number of years.

So far, it has been a great timesaver, but *Applewriter* is still not perfect, and the combination of a number of particular peculiarities led to a disaster on one notable occasion.

One of the most dramatic savings in time and effort allowed by *Applewriter* is the word counting sub-program. It counts words rather slowly, especially in long pieces of text, but even so, I use it almost every day.

An idiosyncrasy of the program is that it can only operate on a chunk of text stored on disk, not in memory. If you have just finished a piece of deathless prose you type control S for 'save', enter the name 'pitfalls' for future reference, and hit RETURN. Then you run the word-counter, and tell it which disk file to work upon.

The next peculiarity is that for some mysterious reason the counter removes all the carriage returns from the document — meaning that the whole thing becomes one long shapeless paragraph. So the procedure is to clear the memory with CTRL-N (for 'new') and use CTRL-L ('load') to fetch your material back from the disk into memory, in its original, neatly formatted state.

It is at this stage that a moment's carelessness can write off hours of hard work

It is at this stage that a moment's carelessness can write off hours of hard work. If your errant fingers type a 'save pitfalls' command instead of 'load pitfalls', the file 'pitfalls' is replaced by the current document in memory. Since the memory is empty, the effect is to wipe out the file.

The first time this happened to me, it was with a short letter, so I put it down to experience and simply bashed the thing out again. The second (and so far latest) occasion was when I lost a whole day's work. I was not at all pleased.

The problem would be avoided if an attempt to save a document with a file-name which already existed gave a warning before overwriting the previous version.

In other respects, *Applewriter IIe* is very good at protecting documents against erasure — the commands to clear the memory and to leave the program altogether both demand positive confirmation. Why, then, does the system allow the replacement of one file with another of the same name, without even the slightest warning?

My only other complaint with *Applewriter* is that it is supplied on disks which are not write-protected. This became a problem only when I used an option provided to format new disks ready to receive data. I made a mistake in telling the machine which disk drive contained the blank disk, and it wiped my program disk clean, leaving me with only one copy.

Apple supplies a disk copying program on the System Master disk, but when I used this in an attempt to reproduce *Applewriter* back on to the wiped disk, the copy would not load. Obviously the program is designed to be uncopiable.

Now a business spreadsheet for home computers

Clear and easy to use

2000 cells
(600 in 16K VIC 20)

Global column width adjustment

Variable individual column width

Insertion or deletion of rows and columns

Save, load and merge capabilities.

Computer Crime

So many people now have access to huge computer networks and databases that security has become a real headache for the banks, government departments and corporations that control them. We describe several cases that have recently come to light.

Most of us are becoming more aware of the problems of 'computer crime' thanks to coverage of the subject in the media and drama series such as 'The Consultant' and 'Bird of Prey', both of which have appeared on the TV over the last year.

What's more, many of the multi-million pound bank swindles which have been hitting the headlines involve corrupt programmers (or 'white collar criminals') manipulating files in order to channel money into bogus accounts.

According to a recent report, Dr Ken Wong, manager of BIS Applied Systems' security and privacy division, estimates that computer-related fraud is running at the rate of £2.5 billion per annum and is likely to escalate 100 per cent over the next few years.

The problem — or perhaps blessing — is that computers are not intelligent; they will only do what programmers tell them to do. But no matter how tight the security surrounding a computer system,

there is always the fear that someone is capable of cracking it — if he or she really wants to.

This raises the whole question of computer security, a subject many people are concerned about due to the vast amount of potentially harmful data concerning both individuals and institutions held on these systems.

According to Adrian Norman, editor of *Computer Insecurity*, "Computer people must have enquiring minds, which are frequently associated with a taste for mild mischief. They are likely to see a computer system's security measures as a personal challenge, and will set about defeating them. In the course of such an exercise they are likely to find their way through the flaws in the defences and put themselves in a position to exploit them for other reasons than harmless fun".

Now that computers are infiltrating all walks of life, many more people have direct access to computerised systems —

Prestel being the prime example.

The information contained on Prestel's computers may not be that vital, but the same principles have been extended to a new scheme called 'Homelink' which is a 'home operated Building Society, banking and tele-shopping service'. Through their TV sets, subscribers to the service can run a Building Society or bank account, transfer money between accounts, buy groceries, send and receive messages to other users, and even book holidays.

Because subscribers have direct access to the bank's and Building Society's computers, security is going to have to be very tight. Indeed they reassure customers that "every financial transaction you make will be rigorously protected by stringent security codes and passwords". We shall see

The following is a selection of some interesting computer crime case studies published in a new book called *Computer Insecurity*.

Mischief

Location/victim: London, UK — Bureau

Perpetrator: Opportunist (schoolboy)

Method: Discovered other users' passwords

A 15-year-old Westminster schoolboy completely cracked the security system of a major London computer timesharing service in 1974, gaining access to the most secret files stored on the computer by other users — able to read and change them at will without anyone noticing. He used no special technical gadgets and started with no special knowledge of the computer's inner workings — instead he relied only on ingenuity and a teletype terminal in his school.

The schoolboy, Joe is part of a new generation of 'computer phreaks' who explore computer systems in the same way that 'phone phreaks' explored the telephone system. Joe worked on the project for only four months, until he was temporarily banned from the computer by his teacher.

Most users of the service have a terminal which is not permanently connected to the computer, and dial into it using the normal telephone system. After reaching the computer, the users must identify themselves by giving an account name and password. The trick Joe used was to listen to the sign-on procedures to learn the account name and password of highly privileged users, and then pretend to be

them in order to gain access to secret files. But this required a long series of steps.

First, Joe found by trial and error that there was nothing to stop him from reading the computer's main memory (although not user files). So he wrote a program to provide him with a printout of the operating system — the software which controls users' programs, terminals, etc.

With this listing, a few tips from programmers at the timesharing service and an obsolete systems manual, he wrote a program to print the teletype line number and account name of every terminal using the timesharing system at any given time.

Thus, by printing this out a number of times he could get a full list of account numbers, but he was still missing the critical passwords. The only way to get that was to eavesdrop on users when they first began to use the computer and actually used the password.

For each line, a timesharing computer has a buffer — a small section of memory which stores data coming from the terminals for a short period until the computer can use it. Using his memory reading program, Joe was able to print out on his terminal the content of any other terminal's buffer.

Studying his operating system printouts, Joe found that the computer had a simple rule for assigning the next line. Thus, all he had to do was watch the buffer on that line, and print out its contents as soon as the user signed on.

In common with most timesharing

systems, most users on this one were not allowed to read files maintained by other users. But a few users, such as system administrators, have special privileges and can look at all files. It was only a matter of time until a privileged user logged in, and then Joe was away.

He had the power to completely take over the system, cutting off other users, changing passwords, and even altering the bills that customers would have to pay.

In fact, he never did anything much with his privileged account numbers. He wrote to the timesharing service and told them what he did, but he never got a reply. A new version of the operating system was introduced on the computer, and Joe said he planned to check it to see if his method still worked.

Pseudo Fraud

Location/victim: USA — Credit cards

Perpetrators: Students in a contest

Method: Various

Transaction Technology Inc., a subsidiary of First National City Bank of New York, sponsored a student contest at California Institute of Technology. They sought the cheapest and most effective technique for defrauding magnetic-stripe cards. (FNCB had its own system: a card containing aluminium foil with holes in it, to be read by a laser.)

At the time of this article there were 500 million cards outstanding and losses were running at \$350 million per annum.

The magnetic stripe on the back of a plastic card contains data encoded at either 200 bits per inch, the IATA standard, or 75 bits per inch, the ABA standard.

There are five basic fraud techniques:

- (i) obtain a list of valid cards with their security numbers;
- (ii) chemical duplication;
- (iii) skimming data from a good card with an electronic pantograph;
- (iv) transfer data from a good card to magnetic tape;
- (v) iron on a new stripe.

The prizes went to two cheap devices:

- 1st Prize — \$5,000 for a BART ticket duplicator
2nd Prize — £1,500 for a \$35 wrist-strap copier

The technique of the winner was shown in the *Business Week* article in a series of six photographs. Using a conventional iron set to the right temperature, the fraudsman 'irons' a piece of magnetic tape over the stripe of a valid card. (The Bay Area Rapid Transit Card is a 'stored fare' card.) The signal from the new card is reproduced on the magnetic tape and this is glued onto the back of an old card whose stored fare has been decremented in normal use to zero. The old card is now 'as good as new'.

Mischief

Location/victim: UK — Heriot-Watt University

Perpetrator: Student

Method: Wrote programs to collect other people's passwords

About 1976, there was a student using the computer centre at Heriot-Watt University who wrote a program to run under timesharing. He left it on disk, knowing that some of the other students would try it out just to see what he was doing. The program started running, and then simulated a systems crash followed by the timesharing sign-on sequence, after which it terminated.

The user number and password entered during the pseudo sign-on were written away to a disk file and subsequently were used as input data to a program that would remove all disk files belonging to the accumulated user numbers.

Altered Data

Location/victim: UK — Thames Polytechnic

Perpetrators: Students; Barry Larrigan et al.

Method: Dumped archive files

Students at Thames Polytechnic were asked to break the security routines on the DEC System 10 as part of their course. During 1977, three students managed to prise open a secure file containing their examination results, amend the marks and return the doctored file to its original place.

The computer science course organiser, Tom Crowe, explained:

I was responsible for the lectures on systems security and used published material (*IBM Systems Journal*). I advised my students that no system was absolutely secure and often the weakest point could be recently developed software.

By way of an exercise I set up a file called MARKS in my account on maximum security giving the students zero marks for the coursework. They were invited to alter the marks to a more appropriate grade.

Barry Larrigan, one of the cracksmen, enquired of Software Support what was the latest facility on our DEC10 system. He was told that it was the archiving facility. He played with it for a while and discovered that although my file MARKS had maximum security in my account it did not have the same security in archive. He proceeded from there.

Larrigan also claimed that during his period of industrial experience he was able to put his employer wise to gaps in security on a DEC system the company was considering.

Digital Equipment Corporation's UK software specialist said 'the user can select his own degree of protection, up to a maximum number of seven. Every file on the System 10 or System 20 has its own protection number. You can set files so that no one can touch them.' He claimed that the security on DEC System 10, which runs under Digital's Total Operating System, is in the hands of the user.

Theft

Location/victim: London, UK — BOAC

Perpetrators: Analyst and programmers

Method: Plagiarised PARS and BOADICEA software

A number of employers of BOAC plagiarised IBM's PARS and BOAC's BOADICEA and offered the information to another software house (or rival international airline?).

The system cost BOAC 300 man years of work and was valued at £2,250,000.

Theft

Location/victim: UK/USA —

Telephone carriers

Perpetrators: Phreaks and fiddlers

Method: Electronic tone generators, equipment modification, misuse of codes

On 13 November 1973, nine men were acquitted of conspiracy to defraud the British Post Office telephone systems after an Old Bailey trial that had started on 3 October and cost £100,000. Ten others had already pleaded guilty and been fined from £25 to £100.

All 19 were phone phreaks; most of them were in their twenties with university degrees and a profound understanding of the telephone networks of the world. In October 1972, GPO investigators discovered them holding a conference in a Hammersmith flat surrounded by telephone equipment, devices for making calls and computer printouts listing 'secret' Post Office codes. Their attitude was described by the judge who tried them thus: 'Some take to heroin, some take to telephones.' For them phone phreaking was not a crime but a hobby to be shared with fellow enthusiasts and discussed with the Post Office openly over dinner and by mail. Their approach and attitude to the world's largest computer, the global telephone system, was that of scientists conducting experiments or programmers and engineers testing programs and systems. The judge appeared to agree, and even asked them for phreaking codes to use from his local exchange.

The cost of preventing phreaking has been high. Besides the expense of the trial, there has been the need for new equipment and systems to detect and identify attackers, and the time of the investigation branch which would be better spent apprehending real villains. Organised and professional criminals were planning to adopt the amateurs' methods, not only in Britain, but in the United States where serious phreaking began in the mid sixties. The ultimate threat is the complete

seizure of the network, using a computer to send calls back and forth till they fill up all the trunk lines.

In the early sixties, students of the Massachusetts Institute of Technology had experimented with the Department of Defense network. They were not prosecuted, but recruited by the operators of the Bell System, the main US network. In 1967, the *Bell Telephone Journal* published an article describing how the network was controlled by tone signals and giving the frequencies involved. The phreaks soon built 'blue boxes' containing tape recordings of electronic organ notes of the right pitch and duration, and later substituted electronic oscillators controlled by push buttons. Because the same lines in the telephone network carry both the signal and the conversation, anyone with access for speaking can also send control instructions to route his calls and switch on and off the charging mechanisms, merely by putting against the mouthpiece a device which makes the right sounds.

The US phone system offers '800' numbers through which companies receive toll-free calls from customers. By dialling in on these lines, but re-routing the call by fooling the exchange equipment, calls could be made to anywhere for no charge. To avoid detection by telephone-company monitors, which analyse the pattern of calls, phreaks prefer to use pay phones, but always get their money back. The US network uses the same routing codes within the trunk network as the caller dials, unlike the British equipment which has register translators to convert from dialled numbers to routing codes. So all the numbers needed by US phreaks were easily discovered, as well as the tones and their meanings.

Whereas phone phreaks may not be villains, some of those interested in their operations certainly are. The Mafia is reported to have ordered 1,000 black boxes to disconnect the billing mechanism for callers placing bets to bookmakers across the United States. Several phreaks made plans to manufacture boxes by the hundreds at a cost of \$25 to \$50. The market price would have been \$2,500 or more.

In Britain, phreaking goes back to the early fifties, when the technique of 'Toll A drop back' was discovered. Toll A was an exchange near St. Pauls which routed calls between London and nearby non-London exchanges. The trick was to dial an unallocated number, and then depress the receiver rest for half a second. This flashing initiated the 'clear forward' signal, leaving the caller with an open line into the Toll A exchange. He could then dial 018, which forwarded him to the trunk exchange — at that time the first long-distance exchange in Britain — and follow it with a code for the distant exchange to which he would be connected at no extra charge.

The signals needed to control the UK network today were published in the *Institution of Post Office Engineers' Journal* and reprinted in the *Sunday Times* (15

October 1972). Signalling System Multi Frequency No. 3 uses pairs of frequencies selected from six tones separated by 120 Hz. With such information, enthusiasts could build 'bleepers' to simulate signals which tell the exchange that, for example, a subscriber has hung up, or a call has been answered and charging should begin, or that a call is coming from another exchange. In the early seventies, a simpler system based on different numbers of pulses with the same frequency (2280 Hz) was used. Details could be found in standard textbooks and journals such as Atkinson's *Telephony and Systems Technology*.

Before STD was widespread, many 'ordinary' people were driven to occasional phreaking from sheer frustration at the inefficient operator controlled trunk system. This came to a head during a strike about 1961 when operators could not be reached. Nothing complicated was needed. Many operators has been in the habit of repeating the codes as they dialled the requested numbers so people soon learnt the numbers they called frequently. The only 'trick' was to know which exchange could be dialled through to pass on the trunk number. Callers also needed a reasonably quiet location, as timing relative to clicks was important.

Phreaks get most enthusiastic about international calls. The International Telegraph and Telephone Consultative Committee, CCITT, publishes a 'White Book', (which cost £50 or so in the early seventies) with all the details needed to phreak the global network. Using the information in it, phreaks would make calls, for example, from one call box to an adjacent one in New York by way of Russia or Australia, just to demonstrate they could do so.

At the Old Bailey phreak trial, the Post Office explained how such calls had been made from Britain. The phreak first dials a spare number at a local call rate but involving a trunk to another exchange. He then sends 'clear forward' to his local exchange, indicating to it that the call is finished; but the distant exchange does not realise because the caller's phone is still off the hook. He now has an open line into the distant trunk exchange and sends to it a 'seize' signal: 'I', which puts him onto its

outgoing lines. Now, if he knows the codes, the world is open to him.

All other exchanges trust his local exchange to handle the billing; they just interpret the tones they hear. Meanwhile, the local exchange collects only for a local call.

Theft

Location/victim: West Coast, USA — Bank

Perpetrators: Programmer and wife

Method: Transferred \$100 from forty-one accounts to wife's

A debt-ridden, 20-year-old programmer in a small West Coast bank, went to work early one morning and ran the computer for a fictitious day. After he got the system running, he gained access to it either by using an on-line terminal or by writing a program. Through this chicanery he managed to transfer \$100 from forty-one different accounts into an account his wife had opened under an assumed name. The couple had planned the swindle for the Memorial Day holiday so they could take the money and run over the long weekend.

Cruising up to a convenient drive-in teller window, the wife began withdrawing the money in \$500 chunks. Because of the \$500 withdrawal limit, she had to make many return trips over a four day period, wearing an assortment of wigs and driving different rental cars.

The operation went on past the holiday weekend. The bank finally noticed when a man came in to check his savings account balance and found \$100 missing. The bank examined the disgruntled man's account and discovered forty other similar \$100 transfers. So the bank wrote a program that compared that day's closing balance with the previous day's and thus located all of the accounts. It also pinpointed the wife's suspicious account. The FBI and local police were promptly called in. They staked out the drive-in teller's window and captured the culprits in the middle of another \$500 withdrawal.

Computer Insecurity, edited by Adrian Norman, is available from Chapman and Hall at £14.95.

ADVANCED Personal Computer??

The

from
NEC

The

from
£1985

Modest advertising is a hallmark of NEC, the leading Japanese microcomputer manufacturer, and one of the world's largest electronics companies. We can now reveal some of the secret features that make the APC something special . . .

Standard features:

- **SPEED:** Full 5 MHz 8086 16 bit processor (true 16 bit data).
- **CAPACITY:** TWO MEGABYTE professional standard 8 inch disks.
- **MEMORY:** 128k user RAM + screen RAM + system ROM + battery-backed CMOS non-volatile RAM & clock/calendar.
- **OPERATING SYSTEM:** Standard CPM-86, (MSDOS & UCSD soon).
- **HIGH RESOLUTION** 8 x 19 dot character screen definition, (25 lines of 80 characters + 26th system status line).
- **AWARD WINNING** NEC 7220 graphic chip in character mode. 256 standard character set includes maths/greek symbols. ADDITIONAL 256 USER-PROGRAMMABLE shape character set(s).
- **KEYBOARD:** Fast 61 key + 25 key numeric/cursor pad + 22 dual mode function keys with labelling facility (16 of which will each hold two 15 character user-defined strings).
- **SERIAL RS-232:** to 19,200 baud synch/asynch. Parallel O/P.
- **PROGRAMMABLE POWER-OFF:** 2 year lithium battery. Music.
- **SUPERB MANUALS:** operating level to full technical spec.
- **COMPACTNESS:** 19 inches wide, 24 inches deep, 14 inches high.
- **PRICE:** unbelievable for the quality of this product from the minicomputer division of NEC.

Optional Extra features:

- **EXPANDABLE USER MEMORY:** in 128k units to 640k RAM.
- **HARD DISKS:** one or two shortly (9 or 18 MB formatted).
- **8 COLOUR SCREEN** (Benchmark & Master-planner use colour).
- **VERY HIGH RESOLUTION GRAPHICS:** 640 x 475 screen from 1024 x 1024 bit-map 8 colour array (384k RAM!). Hardware draw, pan & zoom using 2nd NEC 7220 controller. Fast! Macro shape generation etc with CPM-86 GSX/GSS software.
- **32 BIT HARDWARE ARITHMETIC PROCESSOR:** 25 times CPU speed.

Software:

- **STANDARD CPM-86 SOFTWARE**, plus specific NEC packages:—
- **BENCHMARK** Word Processor.
- **DBASE II** Data Base.
- **MASTERPLANNER** Business Planner/Spread-sheet (From Comshare).
- **SYSTEMATICS** Integrated Accounts Package.
- **RM COBOL.**
- **IBM etc TERMINAL EMULATION.**
- **OUR OWN BESPOKE SOFTWARE** to user's requirements.

The APC — voted Australian Personal Computer of the Year, 1983.
The APC — Top of NEC's range of five microcomputers.
All from NEC — the name you find inside most microcomputers . . .

Working late again?

When NEC - computer-makers to the world - made their own computer, naturally, by cutting out the middleman, they made their own computer more competitive in price. And performance.

Take the new NEC 16-bit Advanced Personal Computer (APC), for example: it can store more information and operate faster and easier than any system in its price range.

The APC and its NEC 3530 Spinwriter has so many unique features - in fact, there are too many to list here.

But on the corner of this page, a small snip could mean a giant leap for your business.

And a little more time for your family.

ELECTRONIC MAIL

Given the phenomenal growth rate of technology and the thousands of people buying computers, it wasn't long before micros could talk to each other. We found out how computers communicate.

Communication lies at the heart of the information technology revolution. It is not enough just to handle and manipulate information, it needs to be communicated and accessible to people in different places. As the number of micros grows, more and more people want to be able to communicate between them and perhaps larger computers.

Not ones to be left behind we decided to try some long distance inter-computer communication of our own when one of our number went off to the USA.

For the experiment we used a couple of Osbornes — although most machines would do — one in the office in London and the new Osborne Executive in Hayward, California.

Once you write something on one computer, like this story, then to send it to another or for you to gain access to information on another computer as in Prestel, the computers must be able to communicate. Easier said than done.

It is a bit like matching up a printer to the computer, there are a number of different protocols used by the computers and several ways of sending the information.

So just what did we do? Well, there are two ways we could have tried to communicate, directly from one computer to another or via some intermediary. For direct communication that would require someone to be at either end at the same time and when you are calling from over 6000 miles away there is quite a time difference. Easier to go through an intermediary — an electronic mailbox.

This is a central computer which acts as a pigeon hole for messages. You are assigned a password for each box you have and can receive or transmit messages from your box to anyone else who has a mail box.

The advantage for long distance work, or to avoid repeated telephone calls until you find someone, is that you can send a message when you want and receive one when you want.

Another advantage is that the message can be sent for the price of a local phone call and retrieved for the same — which at 6000 miles is some saving. The mailbox costs, though, so you have to work out if you will use it enough to justify the standing charge.

Osborne uses an electronic mailbox system, Compuserve, for communication between its various locations in the US and UK. We used another company, BL Systems — yes the people who brought you the Mini Metro from its car division — who operates a mailbox system called Comet. This costs £30 a month per mailbox, with a three month minimum, but there is no storage or access charge.

The use of this intermediary means that almost any teletype terminal, micro or

word processor can be linked provided the micro can act as a terminal since the mailbox is on a mainframe computer.

This story was written using WordStar. For transmissions you can either write the whole story in the non document mode or use one of the PIP utilities, PIP <file name> Z, to strip away the most significant bit in the data byte which removes the various control functions used in WordStar to indicate soft spaces, soft returns etc.

If your message is long, this latter approach is easiest since it saves putting in carriage returns at the end of every line. It is also advisable to transmit in upper case. It is possible to transmit text files generated by some spreadsheet programs, like SuperCalc, and incorporate them into the text.

Once the story was written we used a piece of software which enables the Osborne to act as a terminal. In the US the story was written on the new Osborne Executive which professes to be a 'universal terminal emulator' capable of acting as a terminal with both asynchronous and synchronous computers.

At the end of the first week on the market Osborne reported orders for 25,000 which suggests a lot of interest in the communications capabilities.

The software program we used in the US was called Amcall while in the UK on the Osborne I we used Microlink. These and other programs basically allow the information held in one system to be transmitted to another system.

Information is transmitted either synchronously or asynchronously depending upon the computer. In synchronous communication the data and clock are transmitted on separate wires and transmitted together in timed sequence. This makes transmission faster and decoding easier but is more expensive as it needs more critical circuitry.

This is the way large IBM computers transmit data. In the asynchronous mode the time and data information are mixed together and the characters can be transmitted asynchronously, which tends to be the normal for micros. It is also easiest for marginal quality telephone lines.

Once the story was written and on disk file the next thing to do was to call the mailbox and send it. You do not have to put it on disk in a file but this is easier and quicker than writing it directly into the system.

In Britain there are a number of telephone numbers in different areas which give access to electronic mailboxes, like Comet, locally.

There are far more in the US for the different data transmission networks — at least 34 in the San Francisco Bay area

according to Roy Robinson in technical support here at Osborne in Hayward.

In order to get data from the computer into the phone lines a modem — modulator/demodulator — is necessary. The modem converts the binary information in the computer into tones which can be transmitted across the phone lines. The Osborne modem plugs directly into the back of the phone and the number can be dialled directly from the computer keyboard provided the phone system will allow it.

In the UK, where there are more difficulties about attaching things to the phone lines, many people use an acoustic coupler which is a simpler way of connecting the modem to the phone system without any electrical connection to the phone lines.

It is also more portable and can be used to plug into any standard phone, although normally not trimphones.

The signals sent over the phone go to a local packet switching centre where they are processed by sophisticated equipment and transmitted over high quality circuits to avoid any loss of quality. Then at the other end they are transmitted back over the local phone lines to the receiving computer.

That's the theory, if you're reading this then we know it works.

Once the local access number is dialled there is a tone which indicates there is a connection to the data transmission lines. Then you enter in a series of codes to enable you to get access to the particular mailbox you are using.

In our case this meant getting into the Tymnet system in the USA which required having an identity number (problem number one), going through that to get to Comet in the UK, entering a personal password finding out if there were any messages for us and then sending the story.

The transmission rate is 300 baud which means it takes about one and a half minutes to transmit a full page of A4 typed text.

We also used the mailbox system Osborne uses and sent the story to a mailbox owned by Osborne via Compuserve. Then from London we dialled into this and retrieved the story and got it onto disk in the computer in the office.

Once the story is transmitted there is a confirmation message that it has been received. Then it is up to the recipients to call into their mailboxes regularly to see if there is a message for them.

If there is, they can access it and either read it on their VDU or transfer it onto disk or print it out or all three.

This, however, is really just a simple example of electronic data transmission. Its impact — in publishing, banks, offices, even in the home — is only just beginning.

BUYER'S GUIDE

September

This month has been a busy one for our Buyer's Guide team. The main news is the introduction of the Acorn Electron into the most competitive part of the market — at under £199 it will mean real trouble for the main rivals.

This month's other news includes an attractive deal on the ZX81. A "starter pack" is now available for £45 which includes the ZX81, a 16K RAM pack and one software cassette. One new micro comes from Sharp — the MZ-700 series. At prices of £240 for the basic version and £420

including the integral cassette unit and four-colour printer-plotter, it is a worthy competitor to the Commodore 64 and BBC Micro.

After last month's bout of price cuts, the trend continues this month with a reduction on the Colour Genie, from £199 to £168 and on the CGL M5 from £189 to £150.

Every effort is made to keep the Buyer's Guide up-to-date, but please send any additions to Buyer's Guide Editor, *Which Micro?*, Scriptor Court, 155 Farringdon Road, London EC1R 3AD.

Acorn Electron

Price: £199
Use: **Home/education**
RAM: **32K**
Colour: **Yes**
Language: **Basic**
Interface: **Own**
Supplier: **Acorn Computers 0223 210111**

For: Most of the attributes of the BBC Micro, including class-leading graphics and easy-to-use sound. The structured BBC Basic makes programming easy to understand, and compatibility with most BBC software (with many special Electron versions on the way) makes the Electron a machine you can use right now. The typewriter keyboard makes serious use possible with Electron versions of Acorn's ROM-based word processor and spreadsheet under development.

Against: Some cost-cutting evident, especially in the power supply (no switch).

Conclusion: Guaranteed to cause severe headaches for all competitors.

See Here at Last on page 34.

Sharp MZ-700

Price: £240-£420
Use: **Home/business**
RAM: **64K**
Colour: **Yes**
Language: **Basic**
Interface: **Own**
Supplier: **Tandy 0922 648181**

For: Launched this month, the MZ-700 is well-made, well-documented and good value for money at £240. £420 buys you the model with a built-in cassette recorder and printer/plotter. Makes the BBC look over-priced.

Against: Limited graphics capability and you need to load Basic from cassette.

Conclusion: This is Sharp's latest assault on the home micro market, and looks its best bet yet. But the imminent appearance of the £200 Electron looks like being the nut it will have to crack.

See Sharp Move on page 42.

Price — The costs quoted for each micro are based on the lowest common retail price prevailing at the time of going to press.

But when budgeting for a system remember that the machines will usually require extras to perform their required function. This ranges from access to a television set and cassette recorder, to spending several hundred additional pounds on a printer if the computer is going to be used for serious business purposes.

Use — This gives an idea of what most machines are best suited for — though price tends to be the overriding factor as few non-millionaires would spend £3000 on a computer to play games with. But additionally some micros have large amounts of software and special features that are tailored for a particular market.

RAM — The size of the RAM memory in a computer defines how large and how sophisticated a program can be run. It's generally true that the larger the memory

the better the computer — and the more expensive.

Colour — Micros that show colour when plugged into a colour television are becoming increasingly popular in the home market as price fall. For many business applications, however, colour is not considered that important.

Languages — Nearly all micros offer the Basic computer language which, at the moment, is the easiest and simplest language for

those wanting to learn how to program. Other languages tend to offer more powerful facilities or are specially suited for particular applications.

Interfaces — These are the sockets on a micro which allow such peripherals as printers and modems to be connected and controlled by the computer. The most common is the RS232C interface and a wide range of equipment can be connected to it. Less well-known interfaces may give a more limited choice.

WINNING TREBLE

It takes a precision throw to hit target and an accurate decision to choose the correct printer to suit your requirements. CAE makes your choice easier with the winning treble.

MICROPRISM

The new MicroPrism printer is produced for 'triple top' accuracy – that means quality text at low cost. Basic specification includes 80 cps correspondence quality and 110 cps data with high resolution 84 x 84 d.p.i graphics. The MicroPrism will also accept letter headed or pin feed paper.

PRISM 80 & 132

Small but efficient the Prism 80 & 132 Matrix printers are right on target. Ideal for personal and business use, producing a quality performance every time.

Both provide the speed you require, operating at up to 9600 baud and printing at 200 cps offering the flexibility to match immediate and future needs.

Optional features include high resolution graphics, 250 sheet hopper and FULL COLOUR.

WMSR/9

UNDER £250

Sinclair ZX81

Price: £45 — special offer "starter pack" which includes 16K RAM.

Use: Home
RAM: 1K
Colour: No
Language: Basic
Interface: Own

Supplier: Sinclair Research 0276 685311

For: Sinclair's celebrated ZX81, the computer which broke open the home market, is still available, though for how long this will continue is anyone's guess.

But in recognition of the declining appeal of a black and white computer that costs over £70 — by the time the virtually obligatory 16K of extra memory is purchased — Sinclair has now introduced a £45 starter pack. For this reasonable sum purchasers can acquire a ZX81, a 16K RAM pack and a software cassette.

Against: That membrane keyboard! It's like typing with a sheet of cardboard over the keys.

Although the software is plentiful and cheap, there is virtually no new material coming out, since programmers prefer the Spectrum. It's also worth remembering the speed at which the ZX81 loads programs from cassette — everything happens v-e-r-y s-l-o-w-l-y.

Conclusion: At its new "all inclusive" price of £45 the ZX81 may well have been given a new lease of life. It still won't do half the things you can do on an Oric or Spectrum but it is half the price. As an entrance to Basic (in both senses of the word) it is unique and those on a tight budget can do no better.

May/June 1982 — Inside the ZX81
April 1983 — IBM PC v ZX81
May 1983 — Add-ons for ZX81

Sharp PC1251

Price: £80
Use: Home/office
RAM: 4.2K
Colour: No
Language: Basic
Interface: Own
Supplier: Sharp 061 205 2333

For: When equipped with the optional printer/plotter/micro-cassette unit (about £100), an extremely compact complete system.

Against: You have to write 99%

of your software.

Conclusion: The same company's PC1500, though more expensive, is probably better value for most applications.

Casio PB100

Price: £80
Use: Home/office
RAM: 0.5K
Colour: No
Language: Basic
Interface: Own
Supplier: Casio 01-450 9131

For: Cheap memory expansion to approx. 3K; Basic respectable.

Against: A little expensive compared to its Sharp rival. Small screen size (12 chars) an irritation.

Conclusion: Like the PC1211, more a super powered calculator than a "real computer".

Mattel Aquarius

Price: £80
Use: Home
RAM: 4K
Colour: Yes
CP/M: Not yet
Language: Basic
Interface: Own
Supplier: Mattel Electronics 01-235 7060

For: Excellent documentation and a wide range of games cartridges will attract beginners. The potential for expansion is good, with cheap peripherals such as the printer (£135) available, but don't hold your breath for CP/M.

Against: The main failings are the keyboard (diabolical), the Basic (antiquated), and the prices (quite high for expanded versions).

Conclusion: For users (especially games) rather than programmers.

Jupiter Ace

Price: £90
Use: Home
RAM: 3K

Colour: No
Language: Forth
Interface: Own
Supplier: Jupiter Cantab 0954 80437

For: The cheapest way to get into any language other than Basic.

Against: Virtually no software about, no sound, no colour, poor graphics resolution, Forth language no longer unique since it is now available for most home micros.

Conclusion: An inexpensive curiosity, but of little value to most home micro buyers. Since its launch several colour computers have come down in price to under £100 and the Forth language is now available as an optional extra for many other micros.

November 1982 — Fastest Micro in the Universe?

Casio FX700P

Price: £90
Use: Home/office
RAM: 3K
Colour: No
Language: Basic
Interface: Own
Supplier: Casio 01-450 9131

For: Cheap add-on memory; free program listing library goes some way towards curing software woes.

Against: Same 12 character screen as PB100.

Conclusion: No real moans, but Sharp/Tandy machines seem generally more thoughtful in design.

Sinclair Spectrum

Price: 16K £100 48K £130
Use: Home
RAM: 16K-48K
Colour: Yes
Language: Basic
Interface: Own
Supplier: Sinclair Research 0276 685311

For: As one of the most popular computers, the Spectrum has a very large amount of software support. This means you can get a top-quality version of almost any game or utility, and pay less for it than you would if you had any

other computer.

A similar situation exists on the hardware front. The Sinclair printer is now down to only £39.95, and with the recent launch of the Microdrive (£70) high speed tape access should soon be available.

However, this has not stopped a rush of cheap peripherals from independent manufacturers — digital tracers and interfaces to connect the Spectrum to office-quality printers, among others. These make it possible to build up a very complete system at a very low price.

The carefully-timed price cut will probably improve the support situation, as it is bound to increase the user base.

Against: We just wish the man would fit decent keyboards to his computers. At least it keeps the manufacturers of add-on keyboards in business.

The single-key Basic entry is often rather frustrating, especially for beginners.

Conclusion: At the new price of £100 it is hard to beat the Spectrum if you are a newcomer to home computing.

July/August 1982 — Sinclair's Spectrum v The BBC Micro
February 1983 — Comparison: Oric 1 v Spectrum

Oric 1

Price: 16K £100 48K £140
Use: Home
RAM: 16K-48K
Colour: Yes
Language: Basic
Interface: Parallel
Supplier: Oric International 0990 27641

For: On paper, the Oric is a strong competitor to the Spectrum. Its specifications include useful pre-programmed sounds and high resolution graphics, and the buyer may well prefer the Oric's keyboard and conventional entry of program statements.

The Basic included is a near-standard Microsoft with many powerful extensions, so when software houses have had time to catch up on the recent surge of new machines, programs for the Oric should appear quickly.

Against: The 16K version is still hard to get hold of, lengthy production delays having held up its appearance.

A worrying, but persistent rumour about the Oric is that of problems in the cassette handling area — certainly, ours have never

ADVENTURES

for

ATARI 400/800 32K **BBC** 32K

COMMODORE 64 **LYNX** 48K

NASCOM 32K **ORIC** 48K

SPECTRUM 48K **380Z** 32K

These games are very much bigger than normal adventures that you can buy. They cost £9.90 each, and may well take you months to solve!

1) Colossal Adventure

The classic original "Adventure" with all the original puzzles plus a complete new Master Game.

2) Adventure Quest

An epic puzzle journey through Middle Earth.

3) Dungeon Adventure

A truly massive game with over 100 puzzles to solve.

Page 104

What the reviewers say

"The descriptions are so good that few players could fail to be ensnared by the realism of the mythical worlds where they are the hero or heroine ...

The booklet supplied with each program is very helpful. Extensive information is supplied about the game scenario, saving your current position on tape and there are hints about the sort of words which are understood by the computer. Each of the games has a vocabulary of about 200 words ...

The Level 9 programs are great fun to play, and plenty happens to keep you bemused and amused for hours on end."

— Which Micro & Software Review, August

"A minor miracle of programming",
"An impressive suite of adventures.
They are always a pleasure to play"

— Popular Computing Weekly, 12 May & 23 June

LEVEL 9 COMPUTING

Dept R, 229 Hughenden Road
High Wycombe, Bucks HP13 5PG

BARGAIN-HUNTERS READ THIS!

Whatever your model of Sinclair computer—you can get HOURS of fun, intellectual satisfaction and education for just 95p per month!

A bargain?

That's **Sinclair Programs** magazine—the fat, glossy magazine that's **PACKED** with original, tested programs for you to load and run.

With **Sinclair Programs** every month you can build the library of programs that suits your mood: in recent issues we have challenged our readers with programs to test their skill at Sharpsnooter or Laser Cannon ... jolt their brain cells with Quadratic Equation or Monster Maths ... or take a practical turn with their own word processor program or graphic generator.

That is just a fraction of what you get from **Sinclair Programs**. Each month we have 40 programs for owners of ZX80s, ZX81s and Spectrums. But make sure you don't have to hunt TOO far for your bargains—**Sinclair Programs** always sells out quickly, so order yours TODAY from your newsagent, or fill in the form below and we will send it direct to you, every month.

Mail to: ECC Publications Limited, 30-31 Islington Green, London N1 8BJ Yes — I'd like to subscribe to **Sinclair Programs** (12 issues — price £13.20) I enclose a cheque for £ _____ Please charge my credit card Card: name _____ Number _____ Address _____ Signature _____ Date _____

NB This offer applies to UK subscribers only. Overseas rates available on request.

worked properly, and we have received numerous phone calls mentioning difficulty in loading from tape.

Conclusion: The Oric is a difficult computer to sum up, outshining the Spectrum in some areas, but (as yet) behind in the vital areas of software support and complete documentation. If you want a tried and trusted computer, it might be wise to check the competition first.

February 1983 — Oric I Review

February 1983 — Comparison:

Oric I v Spectrum

May 1983 — Oric I v Vic 20

Comx 35

Price: £120

Use: **Home**

RAM: **35K**

Colour: **Yes**

CP/M: **No**

Language: **Basic**

Interface: **Own**

Supplier: **Computers for All**
0268 418414

For: The Comx has many advanced and unusual features including a built-in joystick, an easy-to-use Basic and lots of memory for the money.

Against: The use of the weird RCA 1802 processor makes the software supply uncertain at best. The Basic is very slow, making games programming virtually impossible without machine code.

Conclusion: In many ways a strong machine — provides interest for the jaded expert.

Nascom 1/2

Price: £125+

Use: **Home/education**

RAM: **1-2K**

Colour: **No**

Language: **Basic**

Interface: **RS232C**

Supplier: **Lucas Logic 0926 497733**

For: Very versatile and easy to upgrade as long as you know your way around the insides.

Against: Too old-fashioned for most home users.

Conclusion: Fine for hardware freaks.

Casio FX702P

Price: £135

Use: **Home/office**

RAM: **3K**

Colour: **No**

Language: **Basic**

Interface: **Own**

Supplier: **Casio 01-450 9131**

For: Built-in statistical and mathematical functions. Display better than on lesser stablemates.

Against: Awkward keyboard.

Conclusion: Mainly of interest to scientific/engineering types.

Commodore Vic 20

Price: £140 (with starter pack)

Use: **Home**

RAM: **5K**

Colour: **Yes**

Language: **Basic**

Interface: **Own**

Supplier: **Commodore 0753-79292**

For: Since the Vic is very widely used, it is well supported by software houses and specialist magazines. Apart from that, it has few advantages over its arch-rival, the Spectrum, except for the keyboard.

It is nice to see a decent keyboard on a cheap computer, indeed, the Vic shares this item with its big brother, the 64. And it is easily available with a huge choice of software.

Against: The standard user memory of 3.5K is far too small for any self-respecting computer these days, and it shows just how much the Vic has dated since its introduction.

Other signs of encroaching obsolescence are the bizarre display with its jumbo character set, the untidy jumble of external apparatus required to run the thing, and the old-fashioned Basic which has been little improved since the early Pet days.

The potential for good sound and graphics is certainly there, but there is no support for the advanced features in Basic, and one is obliged to interfere with memory by means of clumsy POKE statements in order to get anywhere.

The manual is a bit of a joke, but then it does mean healthy sales for the (almost essential) Programmer's Reference Guide.

Conclusion: A good cartridge games machine, but memory expansion is essential for any serious purpose. And the cost of additional memory makes the Commodore 64 a far better buy for those wanting a Commodore machine.

Sept/Oct 1982 — Dragon 32 v Vic 20

May 1983 — Oric I v Vic 20

Atari

Price: 400 £149 800 £299

Use: **Home**

RAM: **400 16K 800 48K**

Colour: **Yes**

Language: **Basic**

Interface: **RS-232C**

Supplier: **Atari (01-900 0511)**

For: Atari produced an excellent games machine in its 400 and 800 home computers, which is no surprise given its background in arcade machines and home games consoles.

What did surprise many industry observers was the readiness of software houses to supply serious software for educational and business purposes, especially on the 800 version with its typewriter keyboard and disk interface.

The software is one of the main reasons for buying an Atari, its quality being consistently high.

Against: There are several drawbacks to becoming an Atari user, including the irritating need for a special cassette recorder at the inflated price of about £45. The touch-sensitive keyboard of the 400 is also rather off-putting, and limits the practical uses of the machine.

Software prices for the Atari seem to be rather high compared to those for rival machines.

Conclusion: The Atari is one of the older machines to enjoy a place in the Top Ten, but still holds up well in any comparison with its rivals.

Recent price cuts and specification improvements have made it more competitive.

CGL M5

Price: £150

Use: **Home**

RAM: **20K**

Colour: **Yes**

CP/M: **No**

Language: **Basic**

Interface: **Own**

Supplier: **Computer Games Ltd**
01-508 5600

For: Even before most of us have actually seen it on the shelves, Sord has cut the price of the M5 by £40. (Could it be they read our review in the July issue?) This makes it more of a potential winner; it's well made, well documented and takes three different Basics in its cartridge slot.

Against: Limited memory is the major drawback. Of the 20K RAM, 16K is used for video, which doesn't leave much space and really makes extra memory in the shape of an expansion box essential for any serious programming. Trouble is, it's not available yet.

Conclusion: The M5 has the potential to become a popular home micro, especially since the price cuts. But the competition is tough: you can now get a 48K Spectrum complete with printer for £170 — and excellent support.

July 1983 — M5 — A double-edge Sord

Texas TI 99/4a

Price: £150

Use: **Home, Education**

RAM: **16K**

Colour: **Yes**

Language: **Basic**

Interface: **Own**

Supplier: **Texas Instruments 0234 67466**

For: The TI99/4a has many features lacking in the competition, yet it has never sold in the numbers of the Vic or Spectrum.

The heart of the computer is its 16-bit processor, Texas Instruments' own, which is reflected in the ease with which the machine can be expanded.

Since the TI is one of the most widely used computers in American schools, it comes as no surprise that a wealth of excellent educational software is available on cartridge.

Graphics and sound facilities are more than adequate, and a wide choice of programming languages is available, though some (like LOGO) require hardware expansion.

The keyboard is particularly pleasant to use, with a light and positive feel.

Against: Despite recent price cuts, it costs a lot to expand the system. The computer itself was very expensive when first introduced, and very little independent software is available.

TI's own software is excellent, but quite expensive.

Conclusion: The TI99/4a is a fundamentally good machine, but recommended only if you know you can get the software you need.

Sept/Oct 1982 — Solid State from Texas

Wizard Software

ARCADE GAMES

ALIENS + **DRAGON 32** **£7.95**
A machine coded Arcade game presented in high resolution graphics. Features 48 invaders, mother ship, 4 defenders per wave, 4 shields + bonus shields. Continuous display of score during game.
RECOMMENDED BY THE MICROCOMPUTER SOFTWARE CLUB.

EVICTOR™ **DRAGON 32 and ORIC-1 48K** **£7.95**
ZX SPECTRUM 48K **£5.95**

An original Arcade game presented in high resolution graphics with machine code for extra zip. Evict the aliens from their self-regenerating and defended base. Features lasers, phasors and bombs. 5 skill levels. Dragon 32 and Oric-1 versions feature a demonstration mode.

RECOMMENDED BY THE MICROCOMPUTER SOFTWARE CLUB.

Also available for the Dragon 32:
DRAGON STARTREK £8.45

CLOWNS	£7.95	RED ALERT	£7.95
WIZARD	£5.95	FRUITA	£5.95
SIRIUS IV	£5.95	TRIPLET	£5.95
GALLEONS	£4.95	SMASH	£6.95

All prices inclusive, mail order, cheques or postal orders to:
WIZARD SOFTWARE, DEPT. WM, P.O. BOX 23, DUNFERMLINE, FIFE, KY11 5RW.

Also available from software retailers in U.K., Europe and Africa. Send large S.A.E. for full program catalogue. Royalties paid for superior quality DRAGON 32 and ORIC-1 software.

GAMES

**OVER 1,000,000 COMPUTER USERS
HAVE BEEN WAITING FOR THESE BOOKS**

£££££'S of entertaining games for only £2.95

Each book contains more than 20 quality games programs, each one specially written for the series. Moving graphics games, arcade games, reflex flexers and brain stretchers are all here, unavailable elsewhere and guaranteed to provide hours of entertainment.

The *Virgin* Computer Games Series

Games For Your ZX 81
Games For Your ZX Spectrum
Games For Your Vic 20
Games For Your BBC Micro
Games For Your Dragon
Games For Your Atari
Games For Your TRS 80
Games For Your Oric

Available from all good bookshops, or for £2.95 + 35p post & packing (£3.30) from
**Computer Books Offer 1, Virgin Books,
61/63 Portobello Road, London W11 3DD.**

Colour Genie

Price: £168
Use: **Home**
RAM: 32K
Colour: **Yes**
Language: **Basic**
Interface: **RS232C**
Supplier: **Lowe Electronic 0629 4995**

For: Full size keyboard with proper keys, good graphics and sound facilities.

Against: Not as compatible with the TRS-80 as earlier Genies, and there isn't much software.

Conclusion: A lot of micro for the money, but check what programs you will be able to buy.
December 1982 — *The Lynx and The Colour Genie*

Sharp PC1500

Price: £169
Use: **Home/office**
RAM: 3.5K
Colour: **No**
Language: **Basic**
Interface: **Own**
Supplier: **Sharp 061 205 2333**

For: Typewriter format keyboard with space bar at centre; memory expandable to 11.5K. A genuine pocket computer with a full Microsoft style Basic. Slightly cheaper than identical Tandy PC2.

Against: Not much software, although independents such as Kuma are beginning to support Sharp's pocket machines.

Conclusion: Well above the programmable calculator level in everything except size.

Texas CC40

Price: £170
Use: **Business**
RAM: 5.5K
Colour: **No**
Language: **Basic**
Interface: **Own**
Supplier: **Texas Instruments 0234 67466**

For: Offering real computer power in a box small enough for one-handed use, the CC40 has a low starter price with a range of accessories and ROM based software on the way. It is easier to use than the Epson if your task is simple, and the keyboard

(although small) is acceptable for typing short documents.

Against: Expansion of the system will be necessary for some applications — in particular, the "wafertape" floppy tape will be almost essential for permanent data storage at about £150.

Conclusion: It may be all the computer power you actually need for some business applications.

June 1983 — *Computing in the lap with the Texas CC40*

Dragon 32

Price: £175
Use: **Home**
RAM: 32K
Colour: **Yes**
Language: **Basic**
Interface: **Parallel**
Supplier: **Dragon Data 0656 744700**

For: After a fairly slow start, the Dragon really took off over Christmas, selling out completely in most shops. This surge of interest seems to have spurred the independent software producers into supporting the machine, since there is now a fair amount of good games material available.

The Dragon's users are typically very enthusiastic about their machine, mentioning the useful extended Basic and typewriter keyboard as strong points. No special tape recorder is necessary, and the machine offers a reasonable display on a domestic TV.

Against: It is disappointing that the Dragon has not inspired a family of cheap peripherals in the same way that the Spectrum has. The addition of a cheap printer in particular would be a real boost.

There is a rather old-fashioned feel to the Dragon which can be pinned down to its lack of a lower case display and crude Microsoft line editor. The latter must be responsible for a lot of wasted time in program development.

Conclusion: The Dragon has many features in its favour, including its British manufacture and fine value for money. A small amount of development on the system software would make it a world beater. But take a look at the comparably priced Electron as well.

Sept/Oct 1982 — *New Dragon 32 v the Vic 20*

April 1983 — *Dragon 32 v Lynx*

Acorn Atom

Price: £175+
Use: **Home**
RAM: 2.12K
Colour: **Optional**
Language: **Basic, Lisp, Forth**
Interface: **Own**
Supplier: **Acorn 0223 245200**

For: Versatile old faithful from the true hobbyist days with a loyal user base.

Against: Outclassed by more recent machines, especially Acorn's new Electron. Software support mainly for basic versions.

Conclusion: Like the Nascom 1, mainly of interest to those who like to tinker.

May/June 1982 — *Acorn's Atomic Fusion*

TRS-80 PC2

Price: £179
Use: **Home/office**
RAM: 3.5K
Colour: **No**
Language: **Basic**
Interface: **Own**
Supplier: **Tandy 0922 648181**

For: Identical to Sharp PC1500.

Against: Costs more.

Conclusion: Draw your own.

Lynx

Price: 48K £225 96K £299
Use: **Home**
RAM: 48K-96K
Colour: **Yes**
Language: **Basic**
Interface: **Serial**
Supplier: **Computers 0223 315063**

For: Whatever else you can say about the Lynx, it must be said that it is an *interesting* machine. £225 buys a compact box with a typewriter keyboard, an unusual structured Basic and 48K of RAM (though only about 13K is available for program storage).

The real interest, however, must be in the potential for turning the Lynx into a business machine.

Computers say that massive amounts of memory expansion will shortly be available, along with a disk operating system (probably CP/M).

If their plans are fulfilled, this will make the Lynx a rival to the Apple II as a realistic small business computer, yet with all the features the home user wants.

Against: As the machine stands, however, it suffers from a lack of software and a somewhat quirky

display with no scrolling and slow screen handling.

The first games software for the Lynx is now becoming available, but it is too soon to say whether or not these programs will overcome the display limitations.

Conclusion: The Lynx could well be a rising star, but at the moment there are surer bets for the home user.

December 1982 — *The Lynx and The Colour Genie*

April 1983 — *Dragon 32 v Lynx*

Commodore 64

Price: £230
Use: **Home, Business**
RAM: 64K
Colour: **Yes**
Language: **Basic**
Interface: **RS-232C**
Supplier: **Commodore 0753 79292**

For: The Vic-20's most obvious failing is its puny memory size, and the lookalike 64 certainly makes up for this with a useful 38K of Basic program space.

The ability to switch out the Basic ROM and overlay it with RAM has been exploited by a number of software houses who have brought out word processors, financial planning packages and other business programs, and a large amount of games software is now becoming available.

Against: Unfortunately, Commodore has not learned from all its mistakes with the Vic.

The documentation supplied is down to their usual standard, and anyone wanting to write his own programs is pretty much on his own. The sound facilities are impressive in hardware terms, but there is no Basic or system support, and all sound modulation is via a clumsy series of POKEs.

Although the infamous 22 column Vic display is replaced by a more readable 40 column display, there is no 80 column option, unusual in what Commodore obviously intends to be an entry-level business system.

The Basic interpreter has improved little since the early Pet days, and now looks dated beside that of the BBC Micro.

Conclusion: The 64 is a great improvement over earlier offerings, but in some ways it represents a missed opportunity for Commodore. And the Electron is worth considering first.

March 1983 — *Commodore 64 Review*

Newbrain A/AD

Price: £233-£267
Use: **Business**
RAM: 32K +
Colour: **No**
Language: **Basic**
Interface: **RS232C**
Supplier: **Grundy Business Systems**
01-997 1171

For: Compact size and optional battery pack make the Newbrain the first 'lap computer'. If the long-promised CP/M ever arrives, it will turn it into a potentially very useful system.

Against: Until that glorious day, users will have to put up with a severe shortage of software. The whole idea of lap computers has been vastly improved upon since the inception of the Newbrain.

Conclusion: Ahead of its time, but out of date. Such is progress in the micro world.

July/August 1982 — *Newbrain Review*

December 1982 — *Microwriter v Newbrain*

£250 TO £500

Micro Professor MPF II

Price: £270
Use: **Home/business/education**
RAM: 64K
Colour: **Yes**
Language: **Basic**
Interface: **RS232C**
Supplier: **Sirtel (UK) 0733 236010**

For: Seems to be quite well built, and should be widely available through retail outlets.

Against: Since it is likely to be less useful than a 48K Spectrum, but costs £100 more, it does not seem to be very good value for most home users.

Conclusion: It is difficult to see the attraction of becoming an MPF II owner.

June 1983 — *MPFII — An Apple for half price?*

and lack of colour will deter home buyers, and the age of the origin design means that the Genie may not have much life left.

Conclusion: Another old favourite from when PCW was new, but now obsolescent.

TRS-80 Colour

Price: £299
Use: **Home**
RAM: 16K
Colour: **Yes**
Language: **Basic**
Interface: **RS232C**
Supplier: **Tandy 0922 648181**

For: Very popular in America, so there is plenty of software if you know where to look (e.g. Molimerx).

Against: Overpriced, especially when compared to the Dragon, which is effectively the expanded TRS-80 Colour at about half the price.

Conclusion: Look at the Dragon first.

November 1982 — *Tandy in Transition*

Nascom 3

Price: £376-£506
Use: **Home/education**
RAM: 8-48K
Colour: **No**
Language: **Basic, Pascal**
Interface: **RS232C**
Supplier: **Lucas Logic 0926 497733**

For: A versatile revision of the earlier Nascoms, particularly good for interfacing with the real world in scientific or industrial applications.

Against: Not really suitable for mainstream home/business use, especially at that price. The British Apple II, but not as well developed or supported.

Conclusion: It doesn't seem long since Nascom was the name for advanced British personal computers. Whatever happened?

BBC Micro

Price: **Mod. B £399**
Use: **Home/education**
RAM: **Mod. A 16K Mod. B 32K**
Colour: **Yes**
Language: **Basic**
Interface: **RS-423**
Supplier: **BBC Micro Systems, PO Box 7, London W 6XJ**

For: Acorn's BBC Micro, is one of the most advanced and user-friendly computers on sale.

The long-term expansion potential is unrivalled by any home micro.

The Basic makes the BBC an excellent device on which to learn programming, and the best of the software exploits the machine fully, to make it outshine its rivals.

As one of the most sophisticated micros, the BBC lends itself to use with new computing ideas.

Against: Though technically excellent recent price cuts on other machines now make it look very over-priced at £400.

However, Acorn's new Electron, selling at £199, may offer the ideal solution to most home buyers, retaining the essential sophistication of the BBC Micro, but making many of the interfaces optional extras. Its launch also means the instant demise of the BBC Model A.

Conclusion: An extremely versatile and impressive computer but expensive.

May/June 1982 — *Auntie's Attractive Features*

March 1983 — *Comparison: BBC Micro and Commodore 64*

May 1983 — *BBC: Can it work in business*

use, and a versatile range of software is available from Epson and others.

Against: The lack of inbuilt arithmetic logic is annoying, all simple calculations having to be done through Basic. The Basic itself is nothing special.

Conclusion: The first truly useful micro to be portable rather than merely transportable. A crop of imitators is on its way with Tandy Model 100 worth a look.

March 1983 — *Epson HX20 Review*

Link 480Z

Price: £450
Use: **Education**
RAM: 32K
Colour: **Yes**
Language: **Basic**
Interface: **IEEE 488**
Supplier: **Research Machines 0865 49866**

For: The 480Z is a low-cost version of the 380Z designed to be used in a network, and provides a cheap way to expand a school's system.

Against: Acorn's Econet with BBC Micros is set to make the RM systems look very old-fashioned and expensive.

Conclusion: OK for those who already use the 380.

Sharp MZ80A

Price: £477
Use: **Home/business/education**
RAM: 48K
Colour: **No**
CP/M: **Extra**
Language: **Basic, Pascal**
Interface: **Other**
Supplier: **Sharp 061 205 2333**

For: Neat all-in-one design is appealing to home or business users — you get a good keyboard, a built-in monitor and an integral cassette drive. Quality of manufacture is very high, and various peripherals (printers, disk drives etc.) are available.

Against: Small user base means that only a few independents provide software.

Conclusion: If you know you can get the software you need, the Sharp could be a good buy.

Epson HX20

Price: £411
Use: **Business**
RAM: 16-32K
Colour: **No**
Language: **Basic**
Interface: **RS232C**
Supplier: **Epson UK 01-900 0466**

For: Remarkably efficient design gives you a 4 x 20 character LCD screen, a mini printer and an optional micro-cassette drive in a package the size of a large paper-back. The keyboard is a joy to

Genie I-2

Price: £299
Use: **Home**
RAM: 16-48K
Colour: **No**
Language: **Basic**
Interface: **RS232C**
Supplier: **Lowe Electronics 0629 4995**

For: Complete compatibility with the worthy but elderly TRS-80 Model I makes Genie a well documented and supported machine. It is a well designed and easy to use machine, with a number of thoughtful touches like the built-in cassette recorder.

Against: The price now looks high against that of the Electron or Commodore 64. Poor graphics

Tandy 100

Price: **£500**
Use: **Business/home**
RAM: **8K-32K**
Colour: **No**
CP/M: **No**
Language: **Basic**
Interface: **RS232C**
Supplier: **Tandy 0922 648181**

For: Superbly compact design brings together true portability and desktop micro power, with excellent built-in software, documentation and LCD display making this the easiest machine to use in its class.

Against: More memory would be useful for storing documents and data files.

Conclusion: One of the very few micros which is genuinely easy for even a raw beginner to use profitably.

Apple II +

Price: **£600**
Use: **Business/education/home**
RAM: **48K**
Colour: **Extra**
CP/M: **Extra**
Language: **Basic**
Interface: **RS232**
Supplier: **Apple UK 1442 60244**

For: Despite being overshadowed by the new IIe, the Apple II+ is still a competent machine available at good discount from many dealers.

Against: Lacks the refinements necessary in a modern business system. Almost all new Apple software has extra features for IIe users.

Conclusion: Comparing specifications, the new IIe is probably a better buy for most potential users.

Andromeda Alpha

Price: **£695-£3695**
Use: **Business**
RAM: **64K**
Colour: **No**
CP/M: **Yes**
Language: **Most**
Interface: **RS-232C**
Supplier: **IT Computer Services 0784 6321 1/2/3**

For: Pricing is keen with Andromeda's unusual "buy the software, get the machine free" deal.

Against: This means less choice of software than you might like, however,

Conclusion: Check very carefully that your needs will be completely met by the software on offer.

Hewlett-Packard HP75C

Price: **£695**
Use: **Business**
RAM: **16-20K**
Colour: **No**
CP/M: **No**
Language: **Basic**
Interface: **RS-232C, HP-IL**
Supplier: **Hewlett-Packard 03446-3100**

For: Almost pocket size makes this the machine with the best power/portability combination. Hewlett snob appeal is strong.

Against: Since it is made by HP the price is pretty hefty, especially compared to machines like the new Tandy 100 and Texas CC40. It is unlikely to achieve similar sales success.

Conclusion: The sort of thing you buy to prove that you can afford one.

Prophet

Price: **£795**
Use: **Business**
RAM: **32K**
Colour: **No**
CP/M: **No**
Language: **Basic**
Interface: **RS-232C**
Supplier: **Busicomputers 0832 72052**

For: Essentially an Acorn Atom with a spreadsheet program built in, the Prophet makes a cheap way of getting into financial modelling.

Against: Loading and saving models on tape takes a long time, and it is difficult to use the machine for other serious business functions.

Conclusion: Even if financial modelling is all you want, it would be better to buy a less limited machine.

Apple IIe

Price: **£845**
Use: **Business, Home, Education**
RAM: **64-128K**
Colour: **Yes**
CP/M: **Extra**

Language: **Most**
Interface: **RS-232 choice**
Supplier: **Apple UK 0442 60244**

For: This new version of the old faithful Apple II is well made and well supported with all kinds of extras available from Apple and independent manufacturers. It is compatible with software written for the Apple II+, but most reputable suppliers are producing new versions to exploit the more advanced design of the new model.

Against: The cost of the IIe is rather high, especially when the US pricing structure is taken into consideration.

Conclusion: A fine machine, worth consideration against many newer designs.

March 1983 — Apple IIe Review

Sharp MZ80B

Price: **£899**
Use: **Home, education, business**
RAM: **64K**
Colour: **No**
CP/M: **Extra**
Language: **Basic, Assembler, Pascal**
Interface: **RS-232C**
Supplier: **Sharp 061-205 2333**

For: Very high build quality typical of Sharp makes the MZ80B a pleasure to use.

Against: The cassette drive fitted needs to be supplemented by disk drives. The range of software available is disappointingly small, so check the availability of what you want with great care.

Conclusion: Never a great seller; unremarkable in most respects.

Andromeda Zita

Price: **£995-£2895**
Use: **Business**
RAM: **64K**
Colour: **No**
CP/M: **Yes**
Language: **Most**
Interface: **RS-232**
Supplier: **IT Computer Services 0784 6321 1/2/3**

For: This portable business machine, a rival to the Osborne I, beats the earlier machine in several ways. The main superiority is in the capacity of the disk drives and the size of the built-in monitor. There is even a Zita with a 12MB winchester disk available.

Against: Actually attempting to carry the thing is guaranteed to stretch your arms. It weighs even more than the Osborne. The usual Andromeda scheme of 'buy the software, get the computer free' applies, so check that you are getting the best programs for the job.

Conclusion: Works fine on a desk-top, as long as your desk is reinforced.

March 1983 — Portability the world over: Zita

NEC PC8001

Price: **£997**
Use: **Business**
RAM: **64K**
Colour: **Yes**
CP/M: **Yes**
Language: **Basic**
Interface: **RS-232**
Supplier: **NEC 01-388 6100**

For: Although it looks like just another CP/M system, the NEC has some nice extra features including an excellent colour monitor and a three processor heart which improves graphics and input/output.

Against: Not much.

Conclusion: A refined option for the small business buyer.

Commodore 700

Price: **from £995**
Use: **Home, business, education**
RAM: **128-256K**
Colour: **No**
CP/M: **Extra**
Language: **Basic**
Interface: **RS-232C, IEEE 488**
Supplier: **Commodore 0753 79292**

For: Less obsolescent than a Commodore 8096, and much prettier. The option of various second processors will let the 700 into the CP/M world.

Against: Not really widely available yet, nor is there much software. Why no 16-bit processor capability?

Conclusion: Worth considering if you know the right software is available.

METACRAFTS FORTH

the language of the 80's

Metacrafts FORTH is the most comprehensive and efficient implementation of the FORTH language available for Apple II computers in the U.K. It is extensible, powerful, transportable, compact and ultra-efficient — definitely the perfect replacement for outmoded and inefficient BASIC.

£79 incl. VAT + p.p. buys you the basic system comprising compiler, screen editor, debugger, assembler, utilities, DOS, FORTH-79 required word set, strings, turtle graphics, 170 page manual, customer support and more.

For an additional £17.25 incl. VAT we can supply a full floating point package that includes all the standard math functions.

The system runs on any Apple II+ or IIe with 48K RAM + 1 disc drive.

Write/phone for further details or send cheque with order to:

THE WIZARD'S WARRIORS: A fast moving game that matches developments in your skill as a player by becoming increasingly more devious. By offering to you the full range of options you can choose how to control your warrior through the maze. A full implementation of this program enables such features as a continuous series of sound effects, arcade quality graphics, double-point scoring, and-for the very artful-bonus lives

FORTH: A full implementation. Ideal for writing fast moving arcade type games. Allows the full colour and sound facilities of the Spectrum to be used. Future Microdrive enhancements will be made available.

ADVENTURE ONE: Features a save game routine as the game can take months to complete.

'A remarkably good version . . . well worth the money.' ...*Sinclair User*...

MAZEMAN: A fast action m/c game that reproduces the spirit of the original '...is very accurate and fast.' ...*Which Micro?*...

CHESS 1.4: Ten levels of play with this m/c program.

Good graphic screen display.

'In a class of it's own.' ...*Your Computer*...

INVADERS: Very fast m/c action. Includes mystery ship and increasingly difficult screens.

EPROM PROGRAMMER MK3

This advanced version of our Mk.2 Programmer will program the popular industry standard 2516, 2716, 2532, 2732, 2564, 2764, and 27128 EPROMS. Disk-based software with all the essential functions for fast and reliable EPROM programming. 14 functions including Check-Empty, Program, Verify, etc; plus 6502 Disk Assembler and Assembler Hex-File loading (CBM or JCL Assemblers). With built-in power supply and new custom case, this is the Programmer Commodore use at Slough! Price £299 + VAT including 2716 personality card.

IEEE BUS-ADAPTOR FOR VIC 20 AND CBM 64

A superior adaptor at a reasonable price. This brand-new item allows you to use standard CBM/PET IEEE disk drives and printers with your VIC or 64. Many advanced features including:

- ★ MINI-DOS support
- ★ Batch file loading
- ★ Gold-plated edge connector for long term reliability
- ★ Selectable default device number for load/save
- ★ Multi-user bus sharing and simultaneous use of the serial bus.

Supplied with instructions detailing these features plus many more. Price £59 + VAT.

BUSINESS ROM and JCL ENHANCED BASIC

The Business ROM is available for the 4000/8000 series machines, and adds 25 additional keywords to your BASIC. Your programs will be easier to write, faster, more reliable and more powerful. Super screen management and input systems coupled with efficient easy-to-use relative file handling . . . and more. Used by many major UK companies who require the best.

Now, the new JCL Enhanced BASIC ROM for the 700 series has even more facilities than the Business ROM, including fast memory transfers and special screen designing functions. Price of Business ROM £80 + VAT. Price of Enhanced ROM for 700 £120 + VAT.

ROM PAGER BOARD

The ROM-Pager is a small board that fits neatly inside 4000 or 8000 series machines. Fitted in seconds (it just plugs in) it provides 8 spare ROM sockets for extra ROMS or EPROMS. Simply call the ROM you want with a POKE. Two versions available, and both leave the USER PORT free. ROM Pager 8 allows up to 8 ROMS to share any one socket. Price £45 + VAT.

ROM Pager 4+4 allows 2 banks of 4 ROMS to share two adjacent sockets. Price £47.50 + VAT.

Commodore dealer.

They came suddenly — without warning — they attacked our planet — viciously and without mercy — the remnants of human kind were scattered throughout the Galaxy — the outsiders took our planet for themselves — built huge ugly cities deep underground — each city housed their ultimate power units — although it has taken 10,000 of your years we have gathered together and developed a ship capable of flying through their defences — we request you fly this ship and deliver the deadly missile into the heart of each and every city you can find — destroy the outsiders and give us back our beloved planet. This is not an easy mission. Complete it and we shall be eternally grateful.

Second Edition Just Published

THE GOOD COMPUTING BOOK FOR BEGINNERS

PLUS a complete practical glossary of terms

If you only buy **ONE** computing book

THIS IS THE CLASSIC!

An entertaining, but **thorough** reference source with the most readable, comprehensive glossary you'll find anywhere. The Good Computing Book for Beginners is an essential A-Z of all the facts you need to know about computing — and none you don't!

Whether you're brand new to computing, or an old hand keen to stay ahead, you'll score by keeping this classic, top-selling book within reach to use again and again.

The author, Dennis Jarrett, is a successful journalist who was also founder editor of Which Computer? magazine — so his first edition quickly became a standard work. Now this new, substantially enlarged and revised edition covers the latest trends, terms and technology with the relevant facts — and **ONLY** the relevant facts — in **plain English**.

Here's another fact you'll find fascinating: it will only cost you **£2.95!**

Use the coupon below to get your copy right away — or buy it soon from your bookshop. It's the **one** book you'll turn to again and again.

Please send me _____ copy(ies) of The Good Computing Book for Beginners by Dennis Jarrett at **£2.95** each plus 50p post and packing. I enclose a cheque for _____

HAWK ELECTRONIC TEST EQUIPMENT

APPLE II/IIe IS A MICRO COMPUTER FOR THE BUSINESS
and

APPLE II/IIe IS ALSO A MICRO COMPUTER FOR THE ENGINEER

The Apple II/IIe is one of the most sophisticated electronic controllers on the market today. Using the Hawk parallel interface card, 32 Channels of I/O are available to control and react with virtually any electronic equipment, eg. machinery control, surveillance systems. Using the Hawk GPIB IEEE expansion card all IEEE controllable equipment can be programmed for automatic testing or automated recording.

HAWK ELECTRONIC TEST EQUIPMENT

Bircholt Road, Parkwood Industrial Estate, Maidstone, Kent ME15 9XT.
Telephone 0622 686811 for more data.

The new concept in instrumentation can now be explored to cut costs in the specialist logic areas with Blind Instruments such as the Hawk 32 Channel 10MHz Logic Analyser fully IEEE controlled at around half the usual price for a Logic Analyser, providing the facility for DISC Storage and Printout of data and formats so you know where you are and where you were. Expand your Apple to a controller and get the best from it.

Apple + Discdrive + Monitor £1090
Hawk 3210 Logic Analyser £2490
IEEE GPIB Interface Card £189
32 Channel via Card £49
The most cost effective Business/Engineering Tool. All prices exclude VAT.

MULTIPLE REGRESSION ANALYSIS £8.95

QUEST

MICROSOFTWARE

FOR ZX SPECTRUM

**The battle could be yours.....
.....but it won't be easy!**

PARTICIPATION – that is the name of OUR game. All our software contains a unique score verification mechanism allowing us to add a new dimension to computer games. Every July and January we will be publishing a ranking list of the top 1000 scorers in each game with the overall top 100 'grand masters' each receiving certificates of merit bearing their position.

September is the last month to qualify for the Black Hole championship. However, from October the sender of the highest valid score each month will win software of their own choice to the value of £50.

The Black Hole is a technicoloured confection of special effects...very demanding; magnificent graphics: (Soft)
The explosion effects are some of the best we have seen.
...[Sinc User]

Totally original game plan. Addictive, challenging and offering a complete visual experience with its animated graphics and violent explosive effects. Compatible with ALL leading joysticks.

If you are looking for something that keep you up all night, cause you to pull your hair out, send you mad with its trickery, then you really shouldn't miss this game.
The mystery of "THE PYRAMID" won't take you a few days to solve, it will probably take you a few months.

QUEST SPECTRUM SOFTWARE is available from W.H.Smiths, John Menzies and Computers For All

**QUEST...
...SIMPLY THE BEST**
