The following BASIC listing can be used to print labels from a View file in macro format. The program allows the user to select which fields from the macro should be printed, the order in which they are to be printed and the number of lines between each label.

Before running this program critical points that should be noted are:

- 1 The printer should be set up and connected to the computer following the instructions in the relevant user guides.
- 2 The starting position on the printer should be checked and adjusted on a short run first to avoid wastage of labels.
- 3 The View file should be carefully checked to ensure that all addresses have the same number of fields, adding commas where necessary.
